- THE PLANS FOR THIS PROJECT WERE REVIEWED ELECTRONICALLY. Applicant must print a fullsized set of the City stamped EPlans using ink that is resistant to water damage. This copy of the City stamped plans must be kept on the job site at all times, protected and maintained in good condition.

- These conditions are part of the approved plans and shall remain attached. The approval of plans and specifications does not permit the violation of any section of the International Building/Residential Code, Uniform Plumbing Code or other ordinances or state law. Conditions as indicated below, along with the unchanged information shown on the drawings must be complied with.

- The approved plans shall not be changed, modified, or altered without authorization from the building official. The approved plans are required to be on the job site. Section 21.06 K.M.C.

Planning Department Conditions:

Planning Department Conditions** Contact Christian Geitz at 425.587.3246

PCD 1. PLN TO PERFORM FINAL PRIOR TO BLD - BUILDING PERMIT INSPECTION CARD MUST BE SIGNED OFF BY PLANNING PRIOR TO ANY REQUEST FOR FINAL BUILDING INSPECTION. PLEASE CALL 425-587-3235 TO REQUEST INSPECTION. 24 HOUR ADVANCE NOTICE REQUIRED FOR INSPECTION.

PCD 2. SENSITIVE AREA DECISION CONDITIONS – All conditions of approval and mitigation standards established under file SAR18-00519 shall be followed.

PCD 3. REVISED SITE PLAN - Any proposed changes to the approved site plan must be submitted as a revision to the building permit for review and approval prior to implementation.

PCD 4. ALL - PROHIBITED VEGETATION - Plants listed as prohibited in the Kirkland Plant List (available from the Planning Department) shall not be planted in the City. These plants include Blackberry, Fragrant water lily, Ivy, Herb Robert, Knotweed, Old man's beard, Poison hemlock, Reed canary grass, Scotch broom, Spurge laurel, Yellow archangel, and Yellow flag iris. Other plants, while not prohibited, are discouraged, including Butterfly bush, English holly, and English laurel.

PCD 5. NON-NATIVE INVASIVE AND NOXIOUS PLANTS (KZC 95.51.5) - It is the responsibility of the property owner to remove non-native invasive plants and noxious plants from the vicinity of any tree or other vegetation that the City has required to be planted or protected. Removal must be performed in a manner that will not harm the tree or other vegetation that the City has required to be planted or protected. Prior to calling for a final inspection remove ivy from all trees from the ground up 5 feet above grade and from the trunk out 1 foot.

PCD 6. ALL - HOURS OF CONSTRUCTION - All development activity and heavy equipment operation is restricted to 7:00 a.m. to 8:00 p.m. Monday through Friday, and 9:00 a.m. to 6:00 p.m. Saturday. Other restrictions on Saturday include: no working in the right-of-way, no work requiring inspection, and no trucking into or out of the site; however, light grading work on-site on Saturday is allowed. NO development activity or heavy equipment operation may occur on Sundays or the following holidays: New Year's Day, Memorial Day, Independence Day, Labor Day, Thanksgiving Day, and Christmas Day.

PCD 7. WETLAND/STREAM BUFFER PROTECTION – Prior to beginning development activities, the applicant shall install a 6-foot-high construction-phase chain link fence or equivalent fence, as approved by the Planning Official along the upland boundary of the entire wetland buffer with silt screen fabric installed per City standard, in a manner approved by the
Planning Department Conditions:
Planning Official. The construction-phase fence shall remain upright in the approved location for the duration of development activities.

PCD 8. SPLIT RAIL FENCE: Prior to Final Inspection, the applicant shall install between the upland boundary of all wetland buffers and the developed portion of the site, either (1) a permanent 3- to 4-foot-tall split rail fence; or (2) permanent planting of equal barrier value; or (3) equivalent barrier, as approved by the Planning Official. Installation of the permanent fence or planted barrier must be done by hand where necessary to prevent machinery from entering the wetland or its buffer.

Public Works Department Conditions:
PUBLIC WORKS CONDITIONS
1. Refer to the Contract Documents for construction of the subject project, including but not limited to all terms, conditions, provisions, agreements, construction plans, specifications, addenda, and all applicable standards, codes, laws, and regulations.

2. The CIP Division of Public Works will manage the construction process and provide inspections for right-of-way /street /public utilities improvements, for land surface modifications, and for construction stormwater pollution prevention /erosion and sediment control. Inspections may be provided by consultant(s) working on behalf of the CIP Division and/or by in-house staff, unless otherwise specified by the Contract Documents.
**How to request an inspection:**
1) Go to [http://www.MyBuildingPermit.com](http://www.MyBuildingPermit.com)
2) Select Kirkland as the Jurisdiction.
3) Select Permit Number or Address.
4) Follow the on-screen instructions.

**REQUIRED INSPECTIONS - DO NOT COVER ANY WORK PRIOR TO INSPECTION**

TREE REMOVAL GENERAL NOTES

1. FOR ALL TREES REMOVED ON PARK SITE (EXCEPT TOTEM LAKE) ALL MATERIAL SHALL BE COMPLETELY REMOVED FROM SITE.
2. FOR ALL TREES REMOVED ON TRAIL SITE (EXCEPT TOTEM LAKE) ALL MATERIAL SHALL BE COMPLETELY REMOVED FROM SITE.
3. FOR ALL TREES REMOVED ON TRAIL AND BOARDWALK SITE ANY PORTION OF TREES REMOVED FROM THE BUFFER THAT OVERLAPS THE WETLANDS SHALL BE REMOVED FROM THE WETLANDS.
4. FOR ALL TREES REMOVED ON TRAIL SITE (EXCEPT TOTEM LAKE) ALL MATERIAL SHALL BE COMPLETELY REMOVED FROM SITE.
5. FOR ALL TREES REMOVED ON TRAIL AND BOARDWALK SITE ANY PORTION OF TREES REMOVED FROM THE BUFFER THAT OVERLAPS THE WETLANDS SHALL BE REMOVED FROM THE WETLANDS.
6. FOR ALL TREES REMOVED ON TRAIL SITE (EXCEPT TOTEM LAKE) ALL MATERIAL SHALL BE COMPLETELY REMOVED FROM SITE.
7. FOR ALL TREES REMOVED ON TRAIL AND BOARDWALK SITE ANY PORTION OF TREES REMOVED FROM THE BUFFER THAT OVERLAPS THE WETLANDS SHALL BE REMOVED FROM THE WETLANDS.
8. FOR ALL TREES REMOVED ON TRAIL SITE (EXCEPT TOTEM LAKE) ALL MATERIAL SHALL BE COMPLETELY REMOVED FROM SITE.
9. FOR ALL TREES REMOVED ON TRAIL AND BOARDWALK SITE ANY PORTION OF TREES REMOVED FROM THE BUFFER THAT OVERLAPS THE WETLANDS SHALL BE REMOVED FROM THE WETLANDS.
10. FOR ALL TREES REMOVED ON TRAIL SITE (EXCEPT TOTEM LAKE) ALL MATERIAL SHALL BE COMPLETELY REMOVED FROM SITE.

Existing Tree Legend

- **Existing Trees to be Removed:** These trees will be removed as part of the project.
- **Existing Trees to be Retained:** These trees will remain after project completion.
- **Existing Trees to be Transplanted:** These trees will be moved to another location as part of the project.
- **Trees to be Staked:** These trees will be supported with stakes.
- **Tree Protection:** Measures will be taken to protect these trees during the project.

**Note:** The diagram includes a detailed map of the park and its surrounding areas, with specific locations marked for tree removal, retention, and protection. The map also indicates the existing tree locations and the buffer zones around them. The city of Kirkland, Washington, is the jurisdiction responsible for the park's design and construction. The project is managed by Berger, an engineering firm, and is monitored by Inland Northwest, a consulting firm. The project is in compliance with the city's urban forest management policies and guidelines.

### IRRIGATION NOTES

1. PROVIDE AND INSTALL ALL IRRIGATION IN CONFORMANCE WITH THE CITY OF KIRKLAND STANDARDS, IN THE EVENT OF CONFLICT BETWEEN NOTES OR DETAILS AND THESE DOCUMENTS, THE STANDARDS SHALL TAKE PRECEDENCE.
2. CONTRACTOR SHALL COMPLY WITH ALL APPLICABLE CODES AND APPROPRIATE SAFETY REGULATIONS.
3. DRAINING IS SCHEMATIC ACTUAL LOCATIONS MAY VARY DUE TO UTILITIES OR EXISTING CONDITIONS. CONTRACTOR IS RESPONSIBLE FOR LOCATING UTILITIES PRIOR TO BEGINNING CONSTRUCTION.
4. EXISTING SODIC, P.S.I. AT IRRIGATION METER IS 108 F.S.I. PRIOR TO INSTALLATION OF IRRIGATION SYSTEM, CONTRACTOR SHALL FILL DOWTIF DRIVE EXISTING P.S.I. NOTIFY OWNER'S REPRESENTATIVE OF ANY DISCREPANCIES BETWEEN THE DESIGN P.S.I. PRIOR TO PROCEEDING W/ WORK.
5. LOCATE QUICK COUPLING VALVE & AUTOMATIC CONTROL VALVES AT POINT OF EASY ACCESS.
6. INSTALL ADJUSTABLE BOLT TO FINAL LOCATION OF ALL QUICK COUPLERS & AUTOMATIC CONTROL VALVES PRIOR TO INSTALLATION.
7. HEAD LOCATION MUST BE ADJUSTED IN THE FIELD TO COMPLY W/ EXISTING SITE CONDITIONS AND PLANT MATERIALS. ADJUST SPRAY PATTERN FOR MAXIMUM COVERAGE AND MINIMUM OVERSPRAY.
8. ALL SHRUB AREA POP-UP SPRAY HEADS TO BE 6" HEIGHT, ALL TURF AREA POP-UPS TO BE 4" IN HEIGHT. (UNLESS OTHERWISE SPECIFIED ON PLAN).
9. CONTRACTOR SHALL COORDINATE IRRIGATION SLEEPING W/ PAVING WORK AS REQUIRED.
10. ALL IRRIGATION SLEEVES SHALL BE 2" IN DIAMETER. SIGNS AND GRAY ARC 60° TO 90°, LIGHT BLUE AND GRAY 110° TO 120°, LIGHT BLUE, WHITE 90° TO 120°.
11. AIR BLOW IRRIGATION SYSTEM THROUGH QUICK COUPLERS TO REMOVE IRREGULARITIES.
12. PIPES TO SHARE TRENCHES WHERE POSSIBLE, SEPARATE COMMON PIPING BY 8" MIN.
13. WHERE PIPE SIZES ARE NOT SHOWN ON THE PLANS, PIPE SHALL BE SIZED TO THE NEXT LARGEST PIPE SIZE SHOWN UPSTREAM ON THE PLAN.
14. WHEN TRENCHING OCCURS AROUND TREES TO REMAIN, THE TREE ROOTS SHALL NOT BE CUT, BUT THE TREE SHALL BE TUNNELED UNDER OR AROUND THE ROOTS BY CAREFUL HAND-DIGGING TO AVOID INJURY TO THE ROOTS.
15. GENERAL CONTRACTOR TO PROVIDE ALL PLUMBING AND ELECTRICAL WORK.
16. GENERAL CONTRACTOR TO PROVIDE POWER SOURCE FOR CLOCK (VERIFY LOCATION PRIOR TO BEGINNING WORK).

APPENDIX D

TREE RISK REPORTS
Matt Martenson  
Berger Partnership  
1721 8th Avenue N  
Seattle, WA 98109

February 15, 2019

Dear Mr. Martenson,

Plans call for a new significant pedestrian corridor which will connect to the Cross-Kirkland Corridor. Mature trees are part of landscaping north of the existing corridor. The planned corridor is composed of two sections:

- Property at 12031 NE Totem Lake Way in Kirkland Washington (KC Parcel #692840-0032) is north of Totem Lake and contains a retail store, and vehicle parking (Figure-1)
- King County (KC) Conservation District (KC Parcel #866372-0060) surrounds Totem Lake and connects to a forested wetland north of the Cross-Kirkland Corridor (Figure-2)

The pathway begins adjacent to a wetland near the southeast corner of 12031-property and travels eastward. Once reaching a location south of property at 12411 NE Totem Lake Way the new trail will cross a wetland devoid of trees and joins the existing corridor.

A previous report provided information on tree species and condition assessments.

In February of 2019 Kurt Fickeisen from Symbiosis Tree Care returned to properties outlined in Figure-1 and Figure-2 to mark trees with visible tags and perform a visual tree risk assessment on many trees within the Cross-Kirkland Corridor that is infrequently used at this time.

This letter contains a report that describes tree identification procedures and provides visual tree risk assessments on within the planned corridor. Please see Assumptions and Limitations for this report (Assumptions and Limitations).

**Summary**

14 trees within the planned trail route represent high risks based on planned use of the corridor. Removal of these high-risk trees is recommended. Retained trees will require monitoring since many represent moderate risks.

**Observations**

Trees were originally identified by the order of inspection and numbered from 1 to 120.

Subsequently metal tree tags were placed on trees at approximately 5-feet above grade in a manor where tags could be viewed while walking on existing trails or pathways

- Trees are numbered from 201 to 300 and 463 to 482
Tree Risk

Using an International Society of Arboriculture Basic Tree Risk Assessment protocol XX trees were evaluated for risk based on visual observations.

Evaluated trees begin southwest of the office building at 12031 Totem Lake Way and travel eastward until reaching a wetland and lake south of 12233 Totem Lake Way. The planned corridor crosses the wetland and lake and encounters a grove of trees close to the existing Cross-Kirkland Corridor (Figure-1, Figure-2)

Pedestrians and bicyclists will be frequently present along the corridor based on future use plans.

56 individual tree risk assessments forms for inspected trees are provided in four spreadsheets (Figure-3A to Figure-3D)

The following trees represent high risks

- No. 280, black cottonwood (*Populus trichocarpa*)
- No. 289, black cottonwood
- No. 295, red alder (*Alnus rubra*)
- No. 464, black cottonwood
- No. 467 to No. 469, black cottonwoods
- No. 471 to No. 473, black cottonwoods
- No. 475, red alder
- No. 476, willow (*Salix Sp.*)
- No. 480 to 481, red alders

The largest group of high-risk trees are numbered 467 to 469 and are in close proximity to the elevated pathway crossing the wetland and creek.

Conclusion

Those trees that represent high risks should be removed prior to completion of the planned trail route. While other moderate risk trees may be retained, these trees will require periodic inspection since future tree or tree trunk failures could disrupt use of the corridor.

If you have questions about the contents of this report contact Symbiosis Tree Care.

Sincerely

Kurt Fickeisen

Assumptions and Limitations

ASSUMPTIONS AND LIMITING CONDITIONS

Kurt Fickeisen
International Society of Arboriculture (ISA) Certified Arborist #RM 451A
ISA Tree Risk Assessment Qualification
American Society of Consulting Arborists Registered Consulting Arborist #472
Owner Symbiosis Tree Care LLC

1. Any legal description provided to the consultant is assumed to be correct. Any titles and
   ownerships to any property are assumed to be good and marketable. No responsibility is assumed
   for matters legal in character.

2. All existing liens, encumbrances, and assessments, if any, have been disregarded (unless
   otherwise noted), and the trees are evaluated as though free and clear, under responsible
   ownership and competent management. It is assumed that no violations of applicable
   governmental regulations have occurred.

3. Care has been taken to obtain all information from reliable sources. All data has been verified
   insofar as possible, however, Symbiosis Tree Care can neither guarantee nor be responsible for
   the accuracy of information.

4. Symbiosis Tree Care shall not be required to give testimony or to attend court by reason of this
   report unless subsequent contractual arrangements are made, including payment of an additional
   fee for such services as described in our fee schedule and contract of engagement.

5. Loss or alteration of any part of this report invalidates the entire report.

6. This report shall be used for its intended purpose only and by the parties to whom it is addressed.
   Possession of this report does not include the right of publication.

7. Neither all or any part of the contents of this report, nor any thereof, shall be conveyed by
   anyone, including the client, to the public through advertising, public relations, news, sales, or
   other media, without the prior expressed written or verbal consent of Symbiosis Tree Care.

8. This report and any values expressed herein represent the opinion of Symbiosis Tree Care. Our
   fee is in no way contingent upon any specified value, a result or occurrence of a subsequent
   event, nor upon any finding to be reported.

9. Sketches, diagrams, graphs, and photographs in this report, being intended as visual aids, are not
   necessarily to scale and should not be construed as engineering or architectural reports or surveys.

10. Unless expressed otherwise: 1) information contained in this report covers only those items that
    were examined and reflects the condition of those items at the time of inspection, and 2) the
    inspection is limited to visual examination of accessible items without dissection, excavation,
    probing, or coring.

11. There is no warranty or guarantee, expressed or implied that problems or deficiencies of the tree
    or other plant or property in question may not arise in the future.

12. The right is reserved to adjust tree valuations, if additional relevant information is made available.
March 14, 2019

Dear Mr. Martenson,

This report has been revised to reflect tree identification numbers installed on February 6, 2019.

Plans call for rerouting the Cross-Kirkland Corridor. Mature trees are part of landscaping north of the existing corridor. The planned corridor is composed of two sections:

- Property at 12031 NE Totem Lake Way in Kirkland Washington (KC Parcel #692840-0032) is north of Totem Lake and contains a retail store, and vehicle parking (Figure-1).
- King County (KC) Conservation District (KC Parcel #866372-0060) surrounds Totem Lake and connects to a forested wetland north of the Cross-Kirkland Corridor (Figure-2).

The pathway begins adjacent to a wetland near the southeast corner of 12031-property and travels eastward. Once reaching a location south of property at 12411 NE Totem Lake Way the new trail will cross a wetland devoid of trees and joins the existing corridor.

Since trees are present in these locations, Kurt Fickeisen from Symbiosis Tree Care came to the property and evaluated 120 trees on and around the property between December 4th and 6th of 2017 (Figure-1, Figure-2).

Based on comments from the City of Kirkland provided in 2018, the report was revised and includes all trees within the corridor. Please see Assumptions Limiting Conditions for this report on the last page.

**Summary**

Plans call for rerouting the Cross-Kirkland Corridor through an area where mature trees are present. The area includes trees adjacent to 12031 NE Totem Lake Way and King County Parcel #866372-0060. 119 trees with diameters over 6-inches grow within this area.

At least one tree located on Totem Lake Way and north of the current building should be removed. Other trees in this area may be preserved if tree protection is possible.

On the eastern side of the building, trees within the KC Conservation District should be considered for preservation, but those near the building or where new pathway placement is required should be considered for removal.
Trees Along Totem Lake Way

Tree inspection starts on the northwest corner of the property and travels eastward along Totem Lake Way. Once reaching the KC Conservation District inspection travels southward and then westward along the 12031-property border. The last tree grouping inspected is those adjacent to the existing parking lot. 

Figure-1A provides a map of these trees (Figure-1A).

A file with information on all trees over 6-inches diameter is provided in a spreadsheet (Figure-3A to Figure-3C). This spreadsheet provides information on tree: species, size, vigor, condition, and comments. Photos of trees are also provided (Photo-1 to Photo-10).

Fifteen trees are located parallel to Totem Lake Way. The majority are red maples (Acer rubrum), but a black cottonwood (Populus trichocarpa) is planted adjacent to the street. In addition, ornamental plum/cherries (Prunus Sp.) are present along with small diameter Douglas firs (Pseudotsuga menziesii).

Most trees have been pruned to provide street and sidewalk clearance, however the red maple numbered 8 has been pruned to provide building clearance

- Tree-208 may not classify as a street tree due to sidewalk setback
- Tree-215 is east of a paved trail on KC Conservation District property

Tree roots may conflict with the existing sidewalk and curb since the canopy overhangs the sidewalk. In addition, tree 205 and 212 are near utility boxes.

Three additional trees numbered 216 to 218 are north of the building but are set back from the street and sidewalk. One is a pacific madrone (Arbutus menziesii). The remaining two are red pines (Pinus resinosa).

- A minor amount of pruning has been performed on pine trees to provide building clearance

Trees North of the 12031 Building

Some trees north of the 12031 building are on the property, but others are within the KC Conservation District or on property containing a motel. Information on tree characteristics is provided in two spreadsheets (Figure-3A, Figure-3B). Additional information is provided below by tree number.

Numbers 219 to 221 consist of two red pines and one Deodar cedar (Cedrus deodar). The trees are on the 12031 property and located on or adjacent to a deck attached to the building. While both pines show signs of good vigor and condition. The Deodar is shaded by adjacent trees (Photo-3)

- All three trees are near building structures

Numbers 222 to 229 consist of Lombardy poplars (Populus nigra) and are marked in Photo-3. All eight poplars are near the 12031 building

Numbers 230 to 234 are north of a paved walkway on the KC Conservation District. Trees consist of black cottonwoods and a columnar variety of beach tree (Fagus sylvatica).

Numbers 235 to 240 are red pines south of the Lombardy poplar group and adjacent to the 12031 building (Photo-4). All are near the 12031 building.
Numbers 241 to 250 are adjacent to the KC Conservation District property and two paved and connected trails. Trees in this group consist of red alders (*Alnus rubra*), black cottonwoods, Douglas firs (*Pseudotsuga menziesii*), and a red maple.

All trees are in fair condition currently however

- Tree 243 leans northward towards the trail
- Trees numbered 248 to 250 are at the edge of an area with visible wetlands

The black cottonwood, number 247, is marked in Photo-5 along with a tree east of inspected trees in this report (Photo-5).

Site conditions may impact long term health and stability of tree 248 and 249 since Douglas fir trees prefer well drained soils (Photo-6).

**Trees South and Southwest of 12031 Pavement**

Trees in this set form a grouping south and west of paved parking and act as a buffer between the wetland and an adjacent property (Photo-7 to Photo-9). Tree characteristics are provided in Figure-3C (Figure-3C). Additional information is provided below by tree number.

Number 251 is a mature red maple growing in a peninsula of soil. Pavement surrounded the soil bed and tree root growth has fractured pavement under the canopy.

Numbers 252 to 255 are young red alders located between a wetland and pavement. The trees appear in fair condition

- Small diameter western red cedars (*Thuja plicata*) grow under alder canopies

Numbers 256 to 259 are mature red maples located between the wetland and pavement. All trees have codominant growth patterns and northern sections of tree canopies overhang paved parking. While there are no visible signs of root growth under pavement, the area is a likely location for significant tree root growth.

- Small diameter western red cedars grow under the canopy of red maples 56 to 58

Numbers 260 to 263 are primarily black cottonwoods, but one red maple is part of this group. All trees are mature and near pavement. While the maple contains a single trunk at grade level, cottonwoods consists of individual trunks joined at root crown level

- Based on proximity of structural roots to pavement, root-pavement conflicts are likely to be present

**Planting Strip Trees**

Planting strip trees are directly west of the structure on the 12031 property. All are mature trees with small statures and are surrounded by pavement under at least 50-percent of the canopy.

Numbers 264 to 266 consist of two flowering cherry trees and one Alaska red cedar (*Chamaecyparis nootkatensis*). All are directly west of the property building and surrounded by pavement.
Numbers 267 to 268 consist of one flowering cherry and one red maple. Both trunks are near the northern edge of the parking lot.

Numbers 269 to 279 consist primarily of crabapple trees, but three flowering cherries are part of the group. All trees are in a planting bed between parking spaces (Photo-10)

- Three members of this group contain numerous stump sprouts

Trees Within King County Conservation District

Trees along the conservation pathway starts adjacent to a wetland near the southeast corner of the 12031 property. The pathway travels eastward and eventually reaching a location south of 12411 NE Totem Lake Way.

Plans call for a new pathway to cross a wetland devoid of trees and joins the Cross Kirkland Corridor in a treed segment of land. 41 trees were evaluated in this section (Figure-2 to Figure-2C).

Trees North of the Wetland

Figure-3D and Figure-3E lists trees north of the wetland in a spreadsheet (Figure-3D, Figure-3E). 34 trees have diameters greater than 6-inches.

Trees 280 to 293 are west of overhead community power lines (Photo-11, Photo-12). Tree species present consist of black cottonwoods (*Populus trichocarpa*), big leaf maples (*Acer macrophyllum*), Douglas firs (*Pseudotsuga menziesii*) and native willows (*Salix Sp.*).

All trees show signs of fair vigor. While tree structure is fair in many trees the following trees show signs of poor structure

- Willow: 284, 85
- Black cottonwood: 287, 288, 290

Most large diameter roots do not appear to interfere with the existing trail.

Trees 294 to 297 are under or near overhead community power lines. All trees show signs of fair vigor. While tree vigor is fair, the following trees show signs of poor structure

- Willow: 294
- Red alder: 296

Most large diameter roots do not appear to interfere with the existing trail.

Trees 298 to 463 are east of overhead community power lines. All trees show signs of fair vigor (Photo-13).

While tree structure is fair in some trees, the following show signs of poor structure

- Willow: 298, 103
- Red alder: 299, 300

Most large diameter roots do not appear to interfere with the existing trail.
Trees 464 to 473 primarily consist of mature black cottonwoods with heights near or over 100-feet (Photo-14). In this case tree information is provided in two spreadsheets (Figure-3D, Figure-3E).

While tree vigor and structure is fair, the following trees show signs of poor structure

- Black cottonwoods 106, 111
  - As an example, trunk decay is present near grade level on the northern side of Tree-111 (Photo-15)

  In this case the current pathway travels within 5-feet of most trees and significant structural roots are present.

Trees South of the Wetland

Figure-3E lists trees south of the wetland in a spreadsheet (Figure-3E). Seven trees have diameters greater than 6-inches.

Trees 475 to 482 consist of red alders, willows, and one black hawthorn (*Crataegus douglasii*) previously tagged with marker number 305 (Photo-16).

All show signs of fair vigor and structure except for one willow (Tree-115). The willow shows signs of poor structure due to decay at grade level

- In many cases new red alder sprouts are emerging from new fill soil

Discussion

Trees along Totem Lake Way

Most trees in this group are near the sidewalk and street. While most are acceptable in parking strip locations, the black cottonwood (Tree-1) is not approved by most municipalities for planting strip location

- If road, sidewalk, utility box, and soil excavation work is not part of upcoming development, tree protection is possible

Remaining trees in this group are set back from the street and building. These include

- Tree-208
- Tree-216 to Tree-218

All have been pruned for building clearance and roots do not appear in close proximity to the building.

These trees can be protected during construction if the future building footprint construction does not come within 5-feet of trunks and root pruning is performed if conflicts are present.

Trees North of the 12031 Building

A significant number of these trees are near the existing building, but other trees are east or south of the walkway traveling through the KC Conservation District.
Based on proximity to existing structures **retention of the following trees is not recommended**

- Red pines numbered 219-220 and 35-40
- Deodar cedar numbered 221
- Lombardy poplar numbered 222 -229

If no construction or construction related impact takes place east or south of the conservation district walkway and within 18-feet of the trunk of the red maple (#50) then trees can be retained, however additional monitoring is recommended.

**Trees South and Southeast of 12031 Pavement**

Most trees in this group are near existing pavement. Based on root buckling observed adjacent to the red maple numbered 251, retention should not be considered unless no pavement excavation is planned during construction.

On the other hand, preservation of red alders numbered 252 to 255 along with small diameter western red cedars south of paved surfaces and under alder and maple canopies should be considered.

**Planting Strip Trees**

All trees in this group are near infrastructure that will be impacted by future construction. Based on space requirements for common construction equipment and material storage, trees in the planting strip should not be retained.

**Trees Within King County Conservation District**

Currently trail use is occasional, however use will increase once development on 12031 property take place and the trail connects to the existing Cross Kirkland Corridor.

**Trees North of the Wetland**

A risk assessment of trees showing signs of poor structure should be considered. While removal of poor structure trees is an option, tree removal will reduce shade provided by trees and the woodland environment that trail users may desire.

Between Tree-280 and Tree-465 conflicts between structural roots and the existing trail are present but minor

- In most cases root pruning should be considered as opposed to tree removal prior to trail surface improvements.

East of Tree-465 the trail enters a tree grove primarily consisting of mature cottonwoods until reaching the wetland. Due to the presence of a mature tree groves with signs of fair vigor and structure, **root pruning is not recommended**.

Options for trail improvement/installation include

- Establishing an elevated trail supported by post and pier anchors
- Installation of a gravel or cobble base layer at grade and use of permeable asphalt for human travel
Trees South of the Wetland

Except for willow numbered 476, all trees evaluated in this group have diameters of 10-inches or less

- Both willows and red alders are short lived trees and are known to regenerate from undamaged stumps

Design plans for future trail in this location are unknown, but soil addition is likely to be required based on construction techniques employed on the adjacent Cross Kirkland Corridor.

While a trail supported by a post and pier system is an option, trunks and canopies of most trees in this group conflict with a future pedestrian trail. In this case tree removal and root sprout regeneration is an option to consider.

Conclusion

Trees Along NE Totem Lake Way

Preservation of the following trees should be considered if protection during construction is possible

- Street trees along Totem Lake Way, and or north of the existing building
- The grove of alders numbered 252 to 255 and adjacent small diameter western red cedars

Removal of other inspected trees is recommended.

Trees Within King County Conservation District

Trees north of the wetland and showing signs of poor structure should be considered for either removal or additional assessment. In areas where trees grow in individual clusters root pruning is recommended. Once the trail enters the mature grove of trees alternatives should be considered prior to trail installation.

Trees south of the wetland appear to conflict with new trail establishment. Based on species most can be cut to grade level and allowed to regenerate from stump sprouts.

Tree Risk

A Level-1 Tree Risk Assessment is provided in a separate report titled

- 11-26-2018 BP Totem Lake 12031 Property Letter

Recommendations

If existing sidewalks will be retained and tree protection fencing is installed during construction, then street trees preservation is possible.

Preservation of the red maple (#208), the pacific madrone (#216) and red pines (#217-218) should be considered if tree canopies do not conflict with construction plans and protection fencing is installed during construction.

All trees east of the trail and on KC Conservation District Property should be retained and monitored.
Preservation of red alders (#252 to #255) and small diameter western red cedars is possible if protection fencing is installed during construction

- Small diameter western red cedars should receive additional protection during removal of adjacent red maples

**Tree Protection Fencing**

When installing protection fencing the material should be located at distance from the trunk equivalent to the radial spread listed in Figure-3A to Figure-3F

If distances for protection fencing are not possible an International Society of Arboriculture Certified Arborist can evaluate root growth patterns and provide protection fencing alternatives.

- Retained sidewalk can be used to mark protection fencing locations
- General diagrams for tree protection fencing are provided (Figure-4A, Figure-4B)

Removal of the following trees should be considered

- Black cottonwood: 287, 288, 290, 466, 471
- Red alder: 296, 299, 100
- Willows: 284, 285, 294, 298, 463
- All species south of the wetland

The City of Kirkland or King County may require additional assessment prior to removal. As an alternative, retention and monitoring should be considered.

**Root Pruning**

Between Tree-80 and Tree-105 tree roots over 2-inches diameter conflicting with the trail should be exposed and cut with reciprocating saws such as a, “sawzall”.

**Root Bridging**

Between Tree-106 and Tree-113 new trails should avoid damage to existing roots over 2-inches diameter. This may require placing the trail on a post and pier support or use of gravel and permeable asphalt

- While two options are provided in this report, there are additional strategies for infrastructure installation that mitigate root damage

If you have questions about the contents of this report contact Symbiosis Tree Care.

Sincerely

Kurt Fickeisen

ASSUMPTIONS AND LIMITING CONDITIONS

Kurt Fickeisen
International Society of Arboriculture (ISA) Certified Arborist #RM 451A
ISA Tree Risk Assessment Qualification
American Society of Consulting Arborists Registered Consulting Arborist #472
Owner Symbiosis Tree Care LLC

1. Any legal description provided to the consultant is assumed to be correct. Any titles and
ownerships to any property are assumed to be good and marketable. No responsibility is assumed
for matters legal in character.
2. All existing liens, encumbrances, and assessments, if any, have been disregarded (unless
otherwise noted), and the trees are evaluated as though free and clear, under responsible
ownership and competent management. It is assumed that no violations of applicable
governmental regulations have occurred.
3. Care has been taken to obtain all information from reliable sources. All data has been verified
insofar as possible, however, Symbiosis Tree Care can neither guarantee nor be responsible for
the accuracy of information.
4. Symbiosis Tree Care shall not be required to give testimony or to attend court by reason of this
report unless subsequent contractual arrangements are made, including payment of an additional
fee for such services as described in our fee schedule and contract of engagement.
5. Loss or alteration of any part of this report invalidates the entire report.
6. This report shall be used for its intended purpose only and by the parties to whom it is addressed.
Possession of this report does not include the right of publication.
7. Neither all or any part of the contents of this report, nor copy thereof, shall be conveyed by
anyone, including the client, to the public through advertising, public relations, news, sales, or
other media, without the prior expressed written or verbal consent of Symbiosis Tree Care.
8. This report and any values expressed herein represent the opinion of Symbiosis Tree Care. Our
fee is in no way contingent upon any specified value, a result or occurrence of a subsequent
event, nor upon any finding to be reported.
9. Sketches, diagrams, graphs, and photographs in this report, being intended as visual aids, are not
necessarily to scale and should not be construed as engineering or architectural reports or surveys.
10. Unless expressed otherwise: 1) information contained in this report covers only those items that
were examined and reflects the condition of those items at the time of inspection, and 2) the
inspection is limited to visual examination of accessible items without dissection, excavation,
probing, or coring.
11. There is no warranty or guarantee, expressed or implied that problems or deficiencies of the tree
or other plant or property in question may not arise in the future.
12. The right is reserved to adjust tree valuations, if additional relevant information is made available.

Attention: Mr. Andy Mitton

Subject: Subsurface Exploration, Geologic Hazard, and Geotechnical Engineering Report
Totem Lake Park
Kirkland, Washington

Dear Mr. Mitton:

We are pleased to present the enclosed copies of the above-referenced report. This report summarizes the results of our subsurface exploration, geologic hazard, and geotechnical engineering studies, and offers recommendations for the design and development of the proposed project. Our recommendations are preliminary in that definite site improvement locations and construction details have not been finalized at the time of this report.

We have enjoyed working with you on this study and are confident that the recommendations presented in this report will aid in the successful completion of your project. If you should have any questions, or if we can be of additional help to you, please do not hesitate to call.

Sincerely,
ASSOCIATED EARTH SCIENCES, INC.
Kirkland, Washington

Bruce L. Blyton, P.E.
Senior Principal Engineer
I. PROJECT AND SITE CONDITIONS

1.0 INTRODUCTION

This report presents the results of our subsurface exploration, geologic hazard, and geotechnical engineering study for the subject project. Our recommendations are preliminary in that construction details have not been finalized at the time of this report. The location of the subject site is shown on the “Vicinity Map,” Figure 1. The approximate locations of the explorations accomplished for this study are presented on the “Site and Exploration Plan,” Figure 2, and on the “Partial Site and Exploration Plan,” Figure 3. In the event that any changes in the nature or design of the proposed project are planned, the conclusions and recommendations contained in this report should be reviewed and modified, or verified, as necessary.

1.1 Purpose and Scope

The purpose of this study was to provide subsurface data to be used in the design and development of the subject project. Our study included a review of available geologic literature, including previous explorations completed by others, drilling five exploration borings, the completion of a series of hand probes, and performing geologic studies to assess the type, thickness, distribution, and physical properties of the subsurface sediments and shallow ground water conditions. Geotechnical engineering studies were also conducted to assess the type of suitable foundation, allowable foundation soil bearing pressures, anticipated foundation settlements, basement/retaining wall lateral pressures, floor support recommendations, and drainage considerations. This report summarizes our current fieldwork and development recommendations based on our present understanding of the project.

1.2 Authorization

Authorization to proceed with this study was granted by Mr. Andy Mitton of Berger Partnership PS. Our study was accomplished in general accordance with our scope of work letter dated March 27, 2017. This report has been prepared for the exclusive use of Berger Partnership PS and its agents for specific application to this project. Within the limitations of scope, schedule, and budget, our services have been performed in accordance with generally accepted geotechnical engineering and engineering geology practices in effect in this area at the time our report was prepared. No other warranty, express or implied, is made. Our observations, findings, and opinions are a means to identify and reduce the inherent risks to the owner.
2.0 PROJECT AND SITE DESCRIPTION

The subject site encompasses 12307 and 12031 NE Totem Lake Way in Kirkland, Washington (King County Parcel Nos. 8663270060 and 6928400032), and consists of a largely undeveloped parcel with an approximate area of 17 acres, and an existing commercial parcel of roughly 1½ acres. The commercial parcel is currently occupied by an existing structure and parking areas, and the largely undeveloped parcel includes Totem Lake, surrounding wetland areas (delineated by others), and existing paved pathways and wooden boardwalks.

It our understanding that current plans include the construction of a new wooden boardwalk across wetland areas at the northeastern portion of the site to connect the existing pathway system to the nearby Cross Kirkland Corridor, and that foundation support for this boardwalk is currently planned to be derived by Diamond Piers®. Site improvements at the existing commercial parcel, after the demolition of existing structures and pavements, include cast-in-place concrete retaining walls, concrete and asphalt pavement, a pre-manufactured restroom building, play equipment, and safety surfacing.

3.0 SITE EXPLORATION

The site exploration was conducted on June 2, 2017 and July 7, 2017, and consisted of five exploration borings and a geologic and geologic hazard reconnaissance to gain information about the site. A series of hand probes were subsequently completed to provide supplemental information to the exploration borings. The various types of materials and sediments encountered in the explorations, as well as the depths where characteristics of these materials changed, are indicated on the exploration boring logs presented in the Appendix. The depths indicated on the logs where conditions changed may represent gradational variations between sediment types in the field. If changes occurred between sample intervals in our borings, they were interpreted. The locations of the exploration borings are shown on the “Site and Exploration Plan,” Figure 2. The conclusions and recommendations presented in this report are based on the exploration borings completed for this study. The number, locations, and depths of the explorations were completed within site and budgetary constraints. Because of the nature of exploratory work below ground, interpolation of subsurface conditions between field explorations is necessary. It should be noted that differing subsurface conditions may sometimes be present due to the random nature of deposition and the alteration of topography by past grading and/or filling. The nature and extent of any variations between the field explorations may not become fully evident until construction. If variations are observed at that time, it may be necessary to re-evaluate specific recommendations in this report and make appropriate changes.
3.1 Exploration Borings

The borings were completed on the subject site using trailer-mounted or hand-portable drilling equipment, each advancing a hollow-stem auger. During the drilling process, samples were obtained at generally 2.5- or 5-foot intervals. The borings were continuously observed and logged by representatives from our firm. The exploration logs presented in the Appendix are based on the field logs, drilling action, and inspection of the samples secured.

Disturbed but representative samples were obtained by using the Standard Penetration Test (SPT) procedure in accordance with American Society for Testing and Materials (ASTM) D-1586. This test and sampling method consists of driving a standard, 2-inch outside-diameter, split-barrel sampler a distance of 18 inches into the soil with a 140-pound hammer free-falling a distance of 30 inches. The number of blows for each 6-inch interval is recorded, and the number of blows required to drive the sampler the final 12 inches is known as the Standard Penetration Resistance (“N”) or blow count. If a total of 50 blows are recorded at or before the end of one 6-inch interval, the blow count is recorded as the number of blows for the corresponding number of inches of penetration. The resistance, or N-value, provides a measure of the relative density of granular soils or the relative consistency of cohesive soils. These values are plotted on the attached boring logs.

The samples obtained from the split-barrel sampler were classified in the field and representative portions placed in watertight containers. The samples were then transported to our laboratory for further visual classification and geotechnical laboratory testing, as necessary.

The various types of soil and ground water elevations, as well as the depths where soil and ground water characteristics changed, are indicated on the exploration boring logs presented in the Appendix of this report. Our explorations and reconnaissance were approximately located by measuring from known site features.

3.2 Monitoring Well

Exploration boring EB-1W was completed as a 2-inch-diameter monitoring well with 10 feet of machine-slotted Schedule 40 polyvinyl chloride (PVC) well screen and a flush-mount monument. The sand pack materials consisted of 10/20 Colorado Silica Sand. The well was sealed with a combination of bentonite chips and concrete. Well construction details are presented on the boring log in the Appendix. Hand-water-level data was collected after well development was completed, on July 31, 2017.
4.0 SUBSURFACE CONDITIONS

Subsurface conditions at the project site were inferred from the field explorations accomplished for this study, visual reconnaissance of the site, and review of applicable geologic literature. As shown on the field logs, the exploration borings generally encountered fill overlying wetland/peat deposits and older in-place sediments. The following section presents more detailed subsurface information organized from the youngest to the oldest sediment types.

4.1 Stratigraphy

Fill

Exploration borings EB-1W and EB-2 through EB-5, encountered fill material that extended to roughly 5 to 12 feet below the ground surface. The fill encountered generally consisted of loose to medium dense, silty fine to medium sand with a variable amount of organic material and gravel. Fill is also expected in unexplored areas of the site, such as the area surrounding and under the existing structure foundations, in existing utility trenches, and at previously graded or landscaped areas. Due to their variable density and content, the existing fill soils are not suitable for foundation support.

Wetland Deposits/Peat

Underlying the fill, exploration borings EB-1W and EB-2 through EB-5, encountered soils generally consisting of peat or organic silt or silty fine sand with occasional rootlets. We interpret these sediments to be representative of recent wetland deposits. These deposits were generally very loose to loose/soft and extended beyond the depth explored of 18 feet below the ground surface at exploration boring EB-5, and to approximately 9.5 to 24.5 feet below the ground surface at the locations of EB-1W and EB-2 through EB-4. Due to the organic soils encountered in this deposit, including peat and organic silt, we expect that this deposit is subject to continued settlement due to decomposition and consolidation in response to surface (fill) loads and is not considered suitable for direct support of foundations or hardscape surfaces without remedial preparation.

Vashon Recessional Outwash

Below the existing peat, exploration boring EB-4 encountered medium dense to dense medium to coarse sand, with varying amounts of silt and gravel, extending below the depth explored of 21.5 feet below the ground surface. These native sediments are interpreted to likely represent Vashon recessional outwash deposits. Recessional outwash sediments were deposited by meltwater streams flowing from the receding Vashon glacier approximately
10,000 years ago. This unit is generally suitable for support of light to moderately loaded foundations and for pavement subbase when properly compacted as discussed in this report.

**Pre-Fraser Non-Glacial Deposits**

Below the existing wetland deposits/peat, exploration borings EB-1W, EB-2 and EB-3 encountered very stiff to hard sandy silt or very dense gravelly sand which extended below the maximum depths explored of 31.5 to 41.5 feet below the ground surface. This soil was interpreted to represent non-glacial deposits placed prior to the Vashon Stade of the Fraser Glaciation and subsequently compacted by the weight of the overlying glacial ice. The very stiff to hard/very dense material is generally considered suitable for support of light to heavily loaded foundations when in an intact, undisturbed condition.

### 4.2 Geologic Mapping/Previous Explorations

Review of the regional geologic map titled *Geologic Map of the City of Kirkland Washington*, by K.A. Troost and A.P. Wisher (2010) indicates that the area of the subject site is underlain by peat deposits (Qp) with Vashon recessional Lake Bretz deposits (Qvrlb), Vashon recessional outwash (Qvr), and pre-Fraser-age deposits (Qpf) mapped nearby. An overprint of modified land (fill) is indicated across the subject site and immediate vicinity. Our interpretation of the sediments described in the referenced exploration logs is in general agreement with the published geologic mapping of the site and vicinity.

Also, the logs of explorations previously completed in 1978 by Earth Consultants at the subject site suggest conditions similar to that encountered in our explorations. The locations of the Earth Consultants borings are shown on the “Site and Exploration Plan,” Figure 2, and the Earth Consultants exploration logs are included in the Appendix.

### 4.3 Hydrology

Ground water was encountered within exploration borings EB-1W and EB-2 through EB-5, between 8 and 18 feet below the ground surface. The measurement taken in EB-1W on July 31, 2017 indicated a piezometric water level of 7.5 feet below the ground surface. We expect ground water across much of the site to lie within the underlying wetland/peat deposits and recessional outwash, and roughly corresponds to the water level in Totem Lake. It should be noted that the occurrence and level of ground water seepage at the site may vary in response to such factors as changes in season, amount of precipitation, and site use.

### 4.4 Hand Probes

Where accessible, a series of hand probes were completed using an 8-foot-long, ½-inch-diameter steel probe to supplement the information collected from exploration borings.
EB-4 and EB-5. In summary, probe depths ranged up to the length of the 8-foot steel probe near the limits of accessibility, and were shallower near to the area of EB-4 or the Cross Kirkland Corridor. The locations and depths of the probes are shown on Figure 3.

Although probe depths less than 2 feet were observed in the relative upland area surrounding the location of exploration boring EB-4, these probes should not be construed as indicators of shallow, dense native soil. Based on the subsurface conditions encountered in exploration borings EB-4 and EB-5, the deeper probes observed in close proximity to the shallow probes, the “modified land” (fill) mapped across the site, and the topography surrounding EB-4, we interpret the shallower probes to likely indicate the presence of medium dense fill material, like that encountered in EB-4, overlying loose/soft, wetland/peat deposits.
II. GEOLOGIC HAZARDS AND MITIGATIONS

The following discussion of potential geologic hazards is based on the geologic, slope, and shallow ground water conditions, as observed and discussed herein.

5.0 SEISMIC HAZARDS AND MITIGATION

Earthquakes occur in the Puget Lowland with great regularity. The vast majority of these events are small, and are usually not felt by people. However, large earthquakes do occur, as evidenced by the 1949, 7.2-magnitude event; the 1965, 6.5-magnitude event; and the 2001, 6.8-magnitude event. The 1949 earthquake appears to have been the largest in this region during recorded history and was centered in the Olympia area. Evaluation of earthquake return rates indicates that an earthquake of the magnitude between 5.5 and 6.0 is likely within a given 20- to 40-year period.

Generally, there are four types of potential geologic hazards associated with large seismic events: 1) surficial ground rupture, 2) seismically induced landslides, 3) liquefaction, and 4) ground motion. The potential for each of these hazards to adversely impact the proposed project is discussed below.

5.1 Surficial Ground Rupture

The nearest known fault trace to the project site is splay of the South Whidbey Island Fault Zone (SWIFZ), located approximately 1 mile to the northeast of the subject site. A recent study by the U.S. Geological Survey (USGS) (Sherrod et al., 2005, Holocene Fault Scarps and Shallow Magnetic Anomalies Along the Southern Whidbey Island Fault Zone Near Woodinville, Washington, Open-File Report 2005-1136, March 2005) indicates that “strong” evidence of prehistoric earthquake activity has been observed along associated fault strands thought to be part of the SWIFZ. The study suggests as many as nine earthquake events along the SWIFZ may have occurred within the last 16,400 years. The recognition of this fault splay is relatively new, and data pertaining to it are limited, with the studies still ongoing. The recurrence interval of movement along this fault system is still unknown, although it is hypothesized to be in excess of 1,000 years. Due to the suspected long recurrence interval, it is our opinion that the potential for damage to the proposed structure by surficial ground rupture is considered to be low. No mitigations other than complying with appropriate codes and standards are recommended.

5.2 Seismically Induced Landslides

The on-site, natural sediments are not sensitive to landsliding given the topographic conditions at the site. No evidence of landslide activity causing distress to existing structures was
observed. Given the subsurface and topographic conditions within and adjacent to the proposed development area and the apparent lack of historical landslide activity, it is our opinion that the risk of damage to the proposed project by landsliding under either static or seismic conditions is low. This opinion is dependent upon site grading and construction practices being completed in accordance with the geotechnical recommendations presented in this report.

5.3 Liquefaction

Liquefaction is a condition where loose, saturated, typically sandy soils lose shear strength when subjected to high-intensity cyclic loads, such as occur during earthquakes. The resulting reduction in strength can cause differential foundation settlements and slope failures. Loose, saturated, fine-grained sands that cannot dissipate the buildup of pore water pressure are the predominant type of sediments subject to liquefaction.

The saturated portions of the fill or silt/sand portions of the wetland deposits encountered in our explorations have the potential to liquefy during a seismic event. However, the underlying Vashon recessional outwash or pre-Fraser-age sediments are not likely to liquefy due to their dense condition.

As discussed in Section 10.0, “Foundations,” a deep foundation system is recommended to transmit the foundation loads into the deeper, non-liquefiable bearing sediments. This will mitigate liquefaction-induced vertical settlement risks to the proposed structures.

Based on our field observations and document review, it is our opinion that the area surrounding the property is likely underlain by liquefiable soils, and that areas of soil may be displaced laterally during a seismic event. The recommended pipe pile foundations embedded into dense, non-liquefiable material will provide some lateral resistance and mitigation to liquefaction damage. However, there is no economically feasible mitigation, in our opinion, for these relatively small structures supported on relatively deep piling to fully resist all movement. The owner must accept the potential risk of ground deformation/lateral spread and associated deflection/damage to the proposed structures.

5.4 Ground Motion

Structural design should follow 2015 *International Building Code* (IBC) standards using Site Class “F” as defined in Table 20.3-1 of *American Society of Civil Engineers (ASCE) 7 – Minimum Design Loads for Buildings and Other Structures.*
6.0 EROSION HAZARDS AND MITIGATION

A properly developed, constructed, and maintained erosion control plan consistent with local standards and best management erosion control practices will be required for this project. It will be necessary to make adjustments and provide additional measures to the Temporary Erosion and Sedimentation Control (TESC) plan in order to improve its effectiveness. Ultimately, the success of the TESC plan depends on a proactive approach to project planning and contractor implementation and maintenance.

The erosion hazard of the site soils is low to moderate, depending primarily on slope and runoff velocity. Maintaining cover measures atop disturbed ground provides significant reduction to the potential generation of turbid runoff and sediment transport. During the local wet season (October 1st through March 31st), exposed soil should not remain uncovered for more than 2 days, unless it is actively being worked. Ground-cover measures can include erosion control matting, plastic sheeting, straw mulch, crushed rock, recycled concrete, or mature hydroseed.

6.1 Erosion Hazard Mitigation

To mitigate the erosion hazards and potential for off-site sediment transport, we recommend the following:

1. All TESC measures for the work area should be installed prior to any activity.

2. During the wetter months of the year, or when large storm events are predicted during the summer months, the work area should be stabilized so that if showers occur, the work area can receive the rainfall without excessive erosion or sediment transport.

3. All disturbed areas should be revegetated as soon as possible. If it is outside of the growing season, the disturbed areas should be covered with mulch.

4. Under no circumstances should concentrated discharges be allowed to flow over the top of steep slopes.

5. Soils that are to be reused around the site should be stored in such a manner as to reduce erosion from the stockpile. Protective measures may include, but are not limited to, covering with plastic sheeting, the use of low stockpiles in flat areas, or the use of straw bales/silt fences around pile perimeters.
III. DESIGN RECOMMENDATIONS

7.0 INTRODUCTION

Our exploration indicates that, from a geotechnical standpoint, the parcel is suitable for the proposed project provided the risks discussed are accepted and the recommendations contained herein are properly followed. The foundation-bearing stratum is generally moderately deep, ranging from roughly 10 to 23 feet or more below present surface grade. Due to the depth of the bearing soils, a driven pipe pile-supported foundation is recommended for the structures to mitigate the risk of post-construction settlement, under both static and dynamic (seismic liquefaction) conditions.

Due to the continued decomposition and consolidation of the peat deposits encountered in our exploration borings, we recommend that accommodations be made to allow for differential settlement between the pile-supported areas and non-pile-supported areas. The degree of long-term settlement due to this decomposition and consolidation of the underlying peat may vary considerably; however, our recent experience at another site adjacent to Totem Lake Park suggests approximate long-term settlement of 6 to 9 inches over a 36-year period. The above-mentioned accommodations allowing for differential settlement between pile-supported and non-pile-supported areas may include extending deep foundation elements out beyond the perimeter of the structures to include surrounding improvements or hardscapes, or flexible connections of the utilities. Also, the use of Diamond Piers® for foundation support of the boardwalk is not recommended due to the continued decomposition and consolidation of the underlying peat deposits.

According to Section 5.2 of the 2016 King County Surface Water Design Manual (adopted by the City of Kirkland), the bottom surface of infiltration facilities “must be in native soil” and “be at least 3 feet above the seasonal high groundwater level and have at least 3 feet of permeable soil beneath”. Due to the shallow ground water seepage observed in the exploration borings (7.5 feet in EB-1W on July 31, 2017) and the presence of existing fill (7 to 12 feet in depth at exploration borings EB-1W, EB-2 and EB-3), along with low-permeability wetland deposits, including peat and silt, it is the opinion of Associated Earth Sciences, Inc. (AESI) that shallow on-site storm water infiltration is not feasible due to existing fill, lateral flow, high fines content, and shallow hydraulic restrictive layers. Storm water infiltration facilities are not recommended at the project site.

We recommend that fills to raise grades be limited to less than one foot in thickness. Should significant fills (greater than one foot) be planned, we anticipate that additional post-construction consolidation of the underlying peat and associated surface settlement is likely under the load of the fill. Should fills be planned under settlement-sensitive structures, we are available to provide situation-specific recommendations to mitigate settlement risk,
such as the preload or surcharging of structural fills, or the use of lightweight fill materials, if needed.

8.0 SITE PREPARATION

Site preparation for the proposed improvements should include removal of all trees, brush, debris, and any other deleterious material from the area of the planned building footprint. Excavation for much of the foundation is anticipated to be minimal. We recommend that any organic topsoil should be stripped from the entire planned building footprint. The sediments encountered in the exploration borings contained a variable percentage of fine-grained material, which makes them moisture-sensitive and subject to disturbance when wet. The contractor must use care during site preparation and excavation operations so that the underlying soils are not softened. If disturbance occurs, the softened soils should be removed and the area brought to grade with structural fill. Due to potential wet subgrade conditions, we recommend that the building footprint area be graded smooth and sloped to drain. The building footprint should then be blanketed with a minimum of 6 inches of clean, crushed, 2-inch rock (railroad ballast). Following placement of the crushed rock, a pipe pile foundation may be installed. AESI can provide field design recommendations for these areas, if needed.

8.1 Temporary Cut Slopes

In our opinion, stable, temporary construction slopes should be the responsibility of the contractor and should be determined during construction. For planning purposes, we anticipate that temporary, unsupported cut slopes in unsaturated (dewatered) existing fill, where encountered, or loose wetland deposits, can be planned at a maximum slope of 1.5H:1V (Horizontal:Vertical). Flatter, temporary cut slopes will be needed if drainage is not installed prior to excavation and ground water seepage is encountered. As is typical with earthwork operations, some sloughing and raveling may occur, and cut slopes may have to be adjusted in the field. In addition, WISHA/OSHA regulations should be followed at all times. Permanent, unsupported cut or structural fill slopes should not exceed a gradient of 2H:1V.

9.0 STRUCTURAL FILL

Structural fill may be necessary to establish desired grades or to backfill around foundations and utilities. All references to structural fill in this report refer to subgrade preparation, fill type, placement, and compaction of materials, as discussed in this section. If a percentage of compaction is specified under another section of this report, the value given in that section should be used. As stated above, should significant fills (greater than 1 foot) be planned, we anticipate that additional post-construction consolidation of the underlying peat and associated
surface settlement is likely under the load of the fill. Should fills be planned under settlement-sensitive structures, we are available to provide situation-specific recommendations to mitigate settlement risk, such as the preload or surcharging of structural fills, or the use of lightweight fill materials, if needed.

After overexcavation/stripping has been performed to the satisfaction of the geotechnical engineer/engineering geologist, the upper 12 inches of exposed ground should be recompacted to a firm and unyielding condition. If the subgrade contains too much moisture, adequate recompaction may be difficult or impossible to obtain and should probably not be attempted. In lieu of recompaction, the area to receive fill should be blanketeted with washed rock or quarry spalls to act as a capillary break between the new fill and the wet subgrade. Where the exposed ground remains soft and further overexcavation is impractical, placement of an engineering stabilization fabric may be necessary to prevent contamination of the free-draining layer by silt migration from below.

After stripping and subgrade preparation of the exposed ground is approved, or a free-draining rock course is laid, structural fill may be placed to attain desired grades. Structural fill is defined as non-organic soil, acceptable to the geotechnical engineer, placed in maximum 8-inch loose lifts, with each lift being compacted to 95 percent of the modified Proctor maximum density using ASTM D-1557 as the standard.

The contractor should note that any proposed fill soils must be evaluated by AESI prior to their use in fills. This would require that we have a sample of the material at least 3 business days in advance to perform a Proctor test and determine its field compaction standard. Soils in which the amount of fine-grained material (smaller than the No. 200 sieve) is greater than approximately 5 percent (measured on the minus No. 4 sieve size) should be considered moisture-sensitive. Use of moisture-sensitive soils in structural fills should be limited to favorable dry weather conditions. The on-site soils contained variable amounts of silt and are considered moisture-sensitive, and we expect that this material may be difficult to compact to structural fill specifications, particularly during and following wet weather. Therefore, we recommend that a select, import material consisting of a clean, free-draining gravel and/or sand be used. Free-draining fill consists of non-organic soil with the amount of fine-grained material limited to 5 percent by weight when measured on the minus No. 4 sieve fraction.

A representative from our firm should inspect the stripped subgrade and be present during placement of structural fill to observe the work and perform a representative number of in-place density tests. In this way, the adequacy of the earthwork may be evaluated as filling progresses and any problem areas may be corrected at that time. It is important to understand that taking random compaction tests on a part-time basis will not assure uniformity or acceptable performance of a fill. As such, we are available to aid the owner in developing a suitable monitoring and testing frequency.
10.0 FOUNDATIONS

We recommend the use of steel pipe piles for the planned structures. Recommendations for pipe pile foundations are included in this section. For preliminary estimating purposes, pile lengths in the 15- to 30-foot range may be assumed. Actual pile lengths may differ significantly from the estimated range depending on local variations in soil conditions, pile size, and driving equipment used. Pile lengths can best be determined by driving a series of test piles.

10.1 Pipe Pile Foundations

Pipe piles should consist of 3-, 4-, or 6-inch-diameter pipe, depending on the required structural loads. Two-inch-diameter piles may be considered for accessory structures, such as retaining walls, or where the installation of larger piles is precluded due to access constraints, such as for the proposed boardwalk. The piles should be galvanized steel pipe, driven with a suitable hammer to the refusal criteria shown in Table 1. The following table provides required minimum hammer weights, refusal criteria, and allowable loads for pipe piles.

* Refusal is defined as less than 1 inch of penetration in "X" seconds under constant driving.
** Allowable load to be verified by load tests in accordance with ASTM D-1143 “quick load test.”

Anticipated settlement of pile-supported foundations should be less than ½ inch. Pile installation must be observed by AESI to verify that the design bearing capacity of the piles has been attained and that construction conforms to the recommendations contained herein. The City of Kirkland may also require such inspections.

Lateral resistance can be derived from passive soil resistance against the buried portion of the foundation (i.e., the grade beam) or from the installation of batter piles. A passive equivalent fluid of 200 pounds per cubic foot (pcf) can be used to account for lateral resistance. Lateral resistance for batter piles should be taken as the horizontal component of the axial pile load. Batter piles are typically installed at 1H:4V inclination.
Pile Inspections

The actual total length of each pile may be adjusted in the field based on required capacity and conditions encountered during driving. Since completion of the pile takes place below ground, the judgment and experience of the geotechnical engineer or their field representative must be used as a basis for determining the required penetration and acceptability of each pile. Consequently, use of the presented pile capacities in the design requires that the installation of all piles be observed by a qualified geotechnical engineer or engineering geologist from our firm, who can interpret and collect the installation data and examine the contractor's operations. AESI, acting as the owner’s field representative, would determine the required lengths of the piles and keep records of pertinent installation data. A final summary report would then be distributed following completion of pile installation.

Load testing should be performed to verify that the design bearing capacity of the piles has been attained. Because of the variation in the soil types and their densities, we recommend that AESI monitor the load-testing program. A common pile load-testing program would consist of one or more 200-percent verification tests of the design bearing capacity of the pile in the soil. Verification test piles are usually loaded in 25-percent increments that are held for 2 minutes up to the final load of 200-percent design load. The 200-percent load is commonly held for 20 minutes and creep-measured. The load is then reduced by 25-percent increments to evaluate the effect of elasticity in the pile to overall displacement.

11.0 LATERAL WALL PRESSURES

All backfill behind retaining walls or around foundation units should be placed as per our recommendations for structural fill and as described in this section of the report. Horizontally backfilled retaining walls that are free to yield laterally at least 0.1 percent of their height may be designed using an equivalent fluid equal to 35 pcf. Fully restrained, horizontally backfilled, rigid walls that cannot yield should be designed for an equivalent fluid of 50 pcf. If roadways, parking areas, or other areas subject to vehicular traffic are adjacent to retaining walls, a surcharge equivalent to 2 feet of soil should be added to the wall height in determining lateral design forces. Retaining walls that retain sloping backfill at a maximum angle of 2H:1V should be designed using an equivalent fluid pressure of 55 pcf for yielding conditions or 75 pcf for fully restrained conditions.

In accordance with the 2015 IBC, retaining wall design should include seismic design parameters. Based on the site soils and assumed wall backfill materials, we recommend a seismic surcharge pressure in addition to the equivalent fluid pressures presented above. A rectangular pressure distribution of 5H and 10H pounds per square foot (psf) (where H is the height of the wall in feet) should be included in design for “active” and “at-rest” loading.
conditions, respectively. The resultant of the rectangular seismic surcharge should be applied at the midpoint of the walls.

The lateral pressures presented above are based on the conditions of a uniform horizontal backfill consisting of the on-site, natural, glacial sediments or imported sand and gravel compacted to 90 percent of ASTM D-1557. A higher degree of compaction is not recommended, as this will increase the pressure acting on the wall.

Footing drains must be provided for all retaining walls, as discussed under the “Drainage Considerations” section of this report. It is imperative that proper drainage be provided so that hydrostatic pressures do not develop against the walls. This would involve installation of a minimum, 1-foot-wide blanket drain to within 1 foot of the ground surface using imported, washed gravel against the walls placed to be continuous with the footing drain.

11.1 Passive Resistance and Friction Factors

Retaining wall grade beams/keyways cast directly against undisturbed dense soils in a trench may be designed for passive resistance against lateral translation using an allowable equivalent fluid equal to 200 pcf. The passive equivalent fluid pressure diagram begins at the top of the grade beam; however, total lateral resistance should be summed only over the depth of the actual key. Since the structure will be pile-supported, we do not recommend using base friction for resistance to lateral loads.

12.0 PAVEMENT/FLOOR SUPPORT

As discussed earlier in this report, existing site soils are considered to be settlement-prone, and floor slabs should be designed as structural slabs and supported on pile foundations to mitigate slab settlement. Where potential post-construction settlement can be tolerated, site soils can be used to support slabs-on-grade, sidewalks, or other similar structures contingent upon remedial preparation and understanding of uncertainties in settlement performance. Slabs, pavement, or segmented paving stones to be supported on grade should be supported on a 2-foot-thick structural fill mat. All fill beneath slabs, paving stones or pavement must be compacted to at least 95 percent of ASTM D-1557. A geotextile separation fabric, such as Mirafi 500X or approved equivalent, should be used between the structural fill and the underlying soil subgrade. A pavement section consisting of 2½ inches of asphaltic concrete pavement (ACP) underlain by 4 inches of 1¼-inch crushed surfacing base course is the recommended minimum in areas of planned passenger car driving and parking.

Interior slabs where control of moisture migration through the slab is needed should be cast atop a minimum of 4 inches of clean washed crushed rock or pea gravel to act as a capillary break. Areas of subgrade that are disturbed (loosened) during construction should be
compacted to a non-yielding condition prior to placement of capillary break material. It should also be protected from dampness by an impervious moisture barrier at least 10 mils thick. The impervious barrier should be placed between the capillary break material and the concrete slab.

13.0 DRAINAGE CONSIDERATIONS

All retaining and perimeter foundation walls should be provided with a drain at the base of the footing elevation. Drains should consist of rigid, perforated, PVC pipe surrounded by washed pea gravel. The level of the perforations in the pipe should be set at or slightly below the bottom of the footing grade beam, and the drains should be constructed with sufficient gradient to allow gravity discharge away from the building. In addition, all retaining walls should be lined with a minimum, 12-inch-thick, washed gravel blanket that extends to within 1 foot of the surface and is continuous with the foundation drain. Roof and surface runoff should not discharge into the foundation drain system, but should be handled by a separate, rigid, tightline drain. In planning, exterior grades adjacent to walls should be sloped downward away from the structure to achieve surface drainage. All collected runoff must be tightlined to a City-approved location.

14.0 PROJECT DESIGN AND CONSTRUCTION MONITORING

Our recommendations are preliminary in that definite structure locations and construction details have not been finalized at the time of this report. We are available to provide additional geotechnical consultation as the project design develops and possibly changes from that upon which this report is based. If significant changes in grading are made, we recommend that AESI perform a geotechnical review of the plans prior to final design completion. In this way, our earthwork and foundation recommendations may be properly interpreted and implemented in the design.

We are also available to provide geotechnical engineering and monitoring services during construction. The integrity of the foundations depends on proper site preparation and construction procedures. In addition, engineering decisions may have to be made in the field in the event that variations in subsurface conditions become apparent. Construction monitoring services are not part of this current scope of work. If these services are desired, please let us know, and we will prepare a proposal.
We have enjoyed working with you on this study and are confident that these recommendations will aid in the successful completion of your project. If you should have any questions or require further assistance, please do not hesitate to call.

Sincerely,
ASSOCIATED EARTH SCIENCES, INC.

Crushed Rock Fill

Moist, gray and brown, silty, fine SAND, trace gravel, trace organics (SM).

As above.

Wetland Deposits

Very moist, light gray, very silty, fine SAND (SM).
Low recovery.

Peat

Wet, dark brown and gray, very silty, fine SAND, some organics (PT/SM).

Very moist, dark brown, highly organic (PT).

As above.

Wetland Deposits

Very moist, gray and brown, silty, fine SAND, trace organics (SM).

Wet, light gray, very silty, fine SAND, some organics, trace gravel (SM/PT).
Driller noted harder drilling.

Pre-Fraser Nonglacial Sediments

Wet, light gray, silty, fine to coarse SAND, some gravel (SM).
Gravelly drill action.

As above.

Wet, light gray, gravelly, fine to coarse SAND, trace silt (SW).
Driller noted heaving sands, could not advance drill.
Bottom of exploration boring at 35.5 feet
### Asphalt - 3.5 inches

**Crushed Rock Fill**

Moist, gray and brown, silty, fine SAND, trace gravel, trace organics (SM).

Low recovery.

Moist and very moist, dark brown and gray, very silty, fine SAND, some organics, trace gravel; organic-rich (SM).

Low recovery.

Moist, light to dark brown, silty, fine SAND, some organics, trace gravel; organic-rich (SM).

Low recovery.

Moist and very moist, gray, very silty, fine SAND, trace organics, trace gravel (SM).

Low recovery.

### Peat

Moist, dark brown, very silty, fine SAND, some organics, trace gravel (PT/SM).

As above.

As above.

Very moist, light gray, sandy, SILT, some organics; zones of peat (PT/ML).

Water on drill rods at 18 feet.

Moist, light gray, sandy, SILT, some organics; massive (PT/ML).

### Pre-Fraser Nonglacial Sediments

Wet, gray, gravelly, fine to coarse SAND, some silt; silt layers (~3" thick) (SM).

Wet, gray, gravelly, fine to coarse SAND, some silt (SM).

Hard drilling.

As above.

As above.

Technical Memorandum

Date: November 20, 2017

To: Berger Partnership P5
1721 8th Avenue North
Seattle, Washington 98109

Attn: Mr. Andy Milton
Address: andym@bergerpartnership.com
Subject: Seismic Site Class

Project Manager: Jeffrey P. Laub, L.G., L.E.G.
Principal in Charge: Bruce L. Blyton, P.E.
Project Name: Totem Lake Park
Project No: 170126E001

We are pleased to present the following supplemental geotechnical information for the Totem Lake Park project in Kirkland, Washington. We are familiar with the project through our participation to date, which includes subsurface exploration; the issuance of our “Subsurface Exploration, Geologic Hazard, and Geotechnical Engineering Report” for the project, dated September 28, 2017; and subsequent design-phase consultation. Recommendations in this memo are based on subsurface data from our September 28, 2017 report and are supplemental to the recommendations contained therein.

In our September 28, 2017 report, we recommended that structural design follow 2015 International Building Code (IBC) standards using seismic Site Class “F” as defined in Table 20.3.1 of American Society of Civil Engineers (ASCE) 7 – Minimum Design Loads for Buildings and Other Structures. This recommendation is based on the peat deposits encountered in the explorations documented in our report. We understand that a designation of Site Class “F” prompts a “site-specific ground motion evaluation” requirement for the project.

We understand that structures proposed as part of the Totem Lake Park improvements project include low site walls and a one-story restroom structure. For these relatively small structures, it is our opinion that a reasonable design approach would be to use parameters for Site Class “E” in lieu of the site-specific seismic study, with the understanding that peat deposits underlie the site. As described in our report, a driven pipe pile-supported foundation is recommended for the structures to mitigate the risk of post-construction settlement, under both static and dynamic (seismic-liquefaction) conditions. This includes the proposed restroom and would be the recommended foundation approach whether the Site Class is “E” or “F.”

We trust that this memorandum will meet your current project needs. If you should have any questions or if we can be of additional help to you, please do not hesitate to call.

Seattle, Washington 98109

Attention: Mr. Andy Mitton

Subject: Geotechnical Addendum
Existing Foundation Observations and Dewatering Considerations
Totem Lake Park
Kirkland, Washington

Dear Mr. Mitton:

As requested, Associated Earth Sciences, Inc. (AESI) presents additional information regarding the proposed demolition of the existing “Yuppie Pawn” building as well as dewatering considerations for utility excavations at the project site. We have previously prepared a “Subsurface Exploration, Geologic Hazard, and Geotechnical Engineering Report,” dated September 28, 2017, for the subject project.

In our September 28, 2017 report, we documented subsurface conditions and groundwater conditions encountered in our explorations. To supplement our previous work and provide information that the contractor can utilize during the demolition of the existing Yuppie Pawn building onsite, we were requested to observe the foundations along the outside of the building by way of exploration pits completed by a mini-track excavator subcontracted to our firm. The explorations were completed on November 19, 2018. We have also been requested to provide recommendations for dewatering (if necessary) for a proposed utility excavation onsite.
The following paragraphs document our observations and provide an update to the recommendations presented in our September 28, 2017 report.

**Building Foundation Observations and Considerations**

Existing foundation observations for our study were based on one large exploration pit dug on November 19, 2018, along the southwest margin of the existing Yuppie Pawn building. The exploration pit was advanced to a total depth of 4 feet by Northwest Excavating and Trucking (NWET), using a rubber-tracked mini trackhoe with an approximately 2-foot-wide toothed bucket. Soils encountered in the excavation consisted of fill soils (soils not naturally placed) to an approximate depth of 3.75 feet below the ground surface. This fill consisted of loose to medium dense sand with varying amounts of silt, gravel, and cobbles. Sediments encountered below the fill consisted of organic-rich peat soils. These conditions are similar to that encountered in our previous explorations at the subject site.

The exploration pit permitted observation of the bottom of the existing building’s foundation, which we observed to be supported by an approximately 12-inch-diameter creosote-treated timber pile (see Photo 1). Additional digging along the southwest margin of the building exposed a second timber pile inward of the building’s outer foundation. We measured a distance of approximately 10 feet between the timber piles.

It should be noted that our observations were limited in nature due to utilities, construction trailers, and other physical and budgetary constraints, and our recommendations are based upon these limited observations. We anticipate that timber piles are also present at each corner of the existing building’s foundation and beneath grade beams which support load bearing walls. Based on our previous exploration onsite and our experience with timber pile installation, we anticipate that the depth of the timber piles to be on the order of 15 to 30 feet, depending on their respective locations around the building.

After demolition of the building and grade beams, the timber piling can either be extracted or cut off and abandoned. For the removal option, a hydraulic vibratory extractor mounted to a large trackhoe is normally used. The remaining holes may experience some collapse/caving as the piles are extracted and should be backfilled immediately with pea gravel or controlled density fill. Backfilling the holes in a timely manner is crucial to the removal process as excess collapse/caving of soft sediments into the holes can produce areas of soft subgrade which can lead to settlement over time.
Alternatively, the existing timber piles can be cut off (usually 2 to 3 feet below final grade) in place and filled over the top of them. This approach is recommended where new structures/utilities will not conflict with the remaining portions of the pile shafts and where differential settlement of soil surrounding the abandoned piles will not be a concern.

**Dewatering Considerations**

In preparation of this report, we were provided with a site plan titled, “Utility Plan - Park” prepared by CH2M. Project plans call for the removal of an existing manhole and replacement with a new precast manhole, which will require an excavation of approximately 10 feet below existing grade. Our previous exploration included installation and development of a groundwater monitoring well (EB-1W) near to the existing manhole. Groundwater seepage was encountered within exploration boring EB-1W at 15 feet below the ground surface at the time of drilling on June 2, 2017. The measurement taken in EB-1W on July 31, 2017, indicated a piezometric water level of 7.5 feet below the ground surface. We expect groundwater across much of the site to lie within the underlying wetland/peat deposits and recessional outwash, and roughly corresponds to the water level in Totem Lake. It should be noted that the occurrence and level of groundwater seepage at the site may vary in response to such factors as changes in season, amount of precipitation, and site use. Our June 2017 explorations were completed during the dry season and groundwater elevations are likely to be higher (closer to existing grade) during the wet season. Based on previous explorations and groundwater level monitoring, it is our opinion that the proposed excavation for the manhole removal and replacement will encounter groundwater seepage and that dewatering system may be needed.

The quantity and duration of flow from an excavation that encounters groundwater depends on a number of factors including topography, size and depth of the excavation, proximity to surface water features, soil grain size, lateral extent of the water-bearing zone or aquifer, and season. Water levels inside the excavation for manhole removal and replacement should be drawn down to at least 2 feet below the base of the excavation. This drawdown is intended, in part, to avoid heaving or flowing soils during construction. It should be noted that dewatering the wetland sediments and/or peat sediments as encountered near the proposed manhole replacement has the potential to cause localized settlement of surrounding features as the water is extracted. An excavation dewatering plan was beyond the scope of this current study and is typically contractor-designed to align with their means and methods of construction. AESI is available to provide review or consultation services in support of a proposed dewatering plan.
If you should have any questions concerning this letter, please do not hesitate to call our office.

Sincerely,

Attention: Mr. Andy Mitton

Subject: Geotechnical Addendum
Pavement Subgrade Improvement
and Updated Groundwater Information
Totem Lake Park
Kirkland, Washington

Dear Mr. Mitton:

As requested, Associated Earth Sciences, Inc. (AESI) presents additional information regarding the proposed Totem Lake Park project. We have previously prepared a “Subsurface Exploration, Geologic Hazard, and Geotechnical Engineering Report,” dated September 28, 2017, and a “Geotechnical Addendum - Existing Foundation Observations and Dewatering Considerations,” dated December 6, 2018, and have provided ongoing design-phase consultation for the subject project.

In our September 28, 2017 report, we documented subsurface conditions and groundwater conditions encountered in our explorations. To supplement our previous work and provide information that the contractor can utilize during construction, we completed a recent, wet-season groundwater measurement in our previously installed monitoring well. We have also been requested to provide recommendations for the improvement of subgrade conditions for proposed surfacing, such as concrete and asphalt pavements, and playground turf areas.

The following paragraphs document our observations and provide an update to the recommendations presented in our September 28, 2017 report.
Pavement Subgrade Improvement

In our September 28, 2017 report, we stated that, where potential post-construction settlement can be tolerated, site soils can be used to support slabs-on-grade, sidewalks, or other similar structures contingent upon remedial preparation and understanding of uncertainties in settlement performance. We recommended that slabs, pavement, or segmented paving stones to be supported on grade be supported on a 2-foot-thick structural fill mat compacted to at least 95 percent of ASTM D-1557, and that a geotextile separation fabric, such as Mirafi 500X or approved equivalent, be used between the structural fill and the underlying soil subgrade.

During discussions with the project design team, we were requested to provide recommendations for subgrade improvement which would reduce the thickness of the structural fill mat below proposed surfacing, such as concrete and asphalt pavements, and playground turf areas. With the addition of triaxial geogrid, such as Tensar TriAx TX130S or approved equivalent, between the structural fill and the underlying soil subgrade, the previously recommended 24 inches of structural fill below these surfaces may be reduced to 16 inches.

Updated Groundwater Information

Our previous exploration included installation and development of a groundwater monitoring well (EB-1W). Groundwater seepage was encountered within exploration boring EB-1W at 15 feet below the ground surface at the time of drilling on June 2, 2017. The measurement taken in EB-1W on July 31, 2017, indicated a piezometric water level of 7.5 feet below the ground surface. In our September 28, 2017 report, we stated that the occurrence and level of groundwater seepage at the site may vary in response to such factors as changes in season, amount of precipitation, and site use. Our June 2017 explorations were completed during the dry season and groundwater elevations are likely to be higher (closer to existing grade) during the wet season. We returned to the subject site on February 7, 2019, to measure a wet-season groundwater level in EB-1W. The measurement taken in EB-1W on February 7, 2019, indicated a piezometric water level of 5.8 feet below the ground surface, approximately 1.7 feet higher than that measured on July 31, 2017. We recommend that proposed excavations for the subject project, including for utilities, be completed during the dry season to reduce the degree of dewatering which may be needed.

Based on review of their topographic survey, the surface elevation at EB-1W is approximately 130 to 131 feet. We recommend that the elevation of EB-1W be surveyed to provide discrete elevation data associated with the above-mentioned measured groundwater depths. Based on our recent groundwater measurement, we anticipate that the proposed underdrains for the proposed bioretention cells, currently planned with a pipe invert elevation of 124.75 feet, may
collect minor groundwater seepage flows during the wet season. Given the silty soils encountered during our previous explorations, we anticipate the discharge associated with collected groundwater to be low, as compared with that associated with collected and routed stormwater flows.

If you should have any questions concerning this letter, please do not hesitate to call our office.

Sincerely,

SECTION 1

Project Overview

Totem Lake is an open water and wetland complex near the intersection of Totem Lake Boulevard and 120th Ave NE in Kirkland, Washington. The lake is within the Juanita Creek Basin and adjacent to the Totem Lake (Category II) wetland. Due to its proximity to the Cross Kirkland Corridor (CKC), Totem Lake Mall, and the Evergreen Hospital, Totem Lake represents a prime opportunity to maintain environmental resources and provide a park facility that offers recreational opportunities, access to nature, and nonmotorized transportation connections. Redevelopment of the Totem Lake area is a top priority of the Kirkland City Council.

This TIR has been developed for the project’s 100-percent design phase and is intended to establish the layout for a park on the existing commercial site, and advance design concepts for boardwalk connections around Totem Lake to the CKC. Additionally, a draft Technical Information Report (TIR) worksheet is included as Figure 1-1 and will continue to be updated as the design of the project progress.

The proposed project improvements represent the first phase of implementation of the Totem Lake Park Master Plan (City of Kirkland 2013), which was adopted by the City of Kirkland in December 2013. The proposed project includes redeveloping an existing commercial parcel with a new park, as well as improving an existing paved trail and constructing a new boardwalk to connect the trail to the nearby CKC. The project vicinity and extent of improvements around Totem Lake are shown on Figure 1-2.

1.1 Existing Site Conditions

The project is located on two separate parcels. One parcel is approximately 18 acres and comprises Totem Lake, surrounding wetland areas, and existing paved pathways and wooden boardwalks. The other parcel is approximately 1.5 acres and comprises a portion of Totem Lake Way and an existing commercial development. The project site is divided into two separate areas or basins within these two parcels, as described below and as shown on Figure 1-3; total area of the project site is approximately 1.53 acres:

- **Park**—The project site includes approximately 1.21 acres of the existing commercial parcel that will be redeveloped as a park. This portion of the project site is bordered by Totem Lake Way to the north, Totem Lake to the south, and adjacent developments to the east and west. The site slopes down from Totem Lake Way to the building and parking lot at approximately 30-percent, then slopes south toward the lake at approximately 5-percent. Stormwater runoff on the commercial parcel is collected in a private drainage system that discharges through an outfall to Totem Lake at the south of the site.

- **Trail and boardwalk**—The project site also includes an existing asphalt paved trail of approximately 0.08 acre and an additional area of 0.24 acre of wetland and buffer of proposed boardwalk and additional trail area. The trail extends east from the commercial site bordering the north of the lake. Its width varies but is approximately on average 6 feet. The longitudinal slope of the trail also varies with slopes up to 5-percent. The area south of the trail slopes down to the lake at approximately 40 percent. Runoff from the existing trail sheet flows down the slope to the lake. The proposed boardwalk will connect the trail to the CKC; most of this area consists of wetland within the ordinary high-water elevation of the lake.

### Part 17 SIGNATURE OF PROFESSIONAL ENGINEER

I, or a civil engineer under my supervision, have visited the site. Actual site conditions as observed were incorporated into this worksheet and the attached Technical Information Report. To the best of my knowledge the information provided here is accurate.

---

Signed/Date
Figure 1-3. Drainage Basins, Subbasins, and Site Characteristics
The parcels that contain the project site are located within the larger Totem Lake Basin. The Totem Lake Basin is a major tributary of Juanita Creek, originating from Totem Lake and flowing through culverts under main roads, including Interstate 405 (I-405), through a series of wetlands and commercial and residential areas, before flowing down a steep drainage system to Juanita Creek. Additional information of downstream conditions is provided in Section 3, Offsite Analysis.

The Totem Lake wetland is approximately 18 acres and its tributary area is approximately 665 acres. The wetland receives water from 80 percent of the drainage basin above I-405, making it a critical natural component of the watershed (City of Kirkland, 2015). The CKC collects and transports most of the basin’s runoff to Totem Lake.

### 1.2 Existing Utilities

Following are existing utilities along Totem Lake Way, bordering the north side of commercial site:

- Sanitary sewer, owned by Northshore Utility District
- Potable water main, owned by Northshore Utility District
- Underground power, owned by Puget Sound Energy
- Underground gas, owned by Puget Sound Energy
- Underground communication lines, ownership unknown at this time
- Storm sewer, owned by City of Kirkland

The existing utilities under adjacent roadway and existing sidewalk within Totem Lake Way will be protected so that they can remain in place. Utility services to the existing building on the commercial site will be abandoned within the project limits. The existing water and sewer service connections will be reused as described in Section 5.3. Totem Lake Way drains to an outfall located at the southwest corner of the commercial site. The outfall will be protected to remain in the current location.

### 1.3 Soils

A Natural Resources Conservation Service soil survey was printed of the site and one-quarter mile downstream area. This is shown on Figure 1-4; the legends and land cover summary of this survey are attached in Appendix B. The soil map shows that most of the site is in SK (Seattle Muck), while the eastern portion is with soil Everett (EvC). Seattle Muck is a hydrological group D soil and Everett is a hydrological group A soil.

A geotechnical investigation was conducted by Associated Earth Sciences, Inc. (AESI) during June and July 2017 to determine the soil composition and feasibility of constructing and adding stormwater facilities at the site. Exploration borings contained fill material extending to approximately 5 to 12 feet below the ground surface. Beneath the fill, the soil generally comprises peat and wetland soils, then glacially deposited sand, and very dense and stiff gravelly sand.

Due to the soil composition, including presence of fill, permeability of wetland deposits, and groundwater level, AESI (2017) concluded that onsite stormwater infiltration is infeasible. Section 5.2 of the *King County Surface Water Design Manual* (KCSWDM; King County, 2016) instructs that the bottom surface of infiltration facilities “must be in native soil” and “be at least 3 feet above the seasonal high groundwater level and have at least 3 feet of permeable soil beneath”, leading AESI to draw the above conclusion.

1.4 Proposed Conditions

The proposed improvements are summarized below and shown in detail on the design drawings in Appendix A; area calculations of existing and proposed conditions are provided in Table 1-1. Additionally, Figure 1-5 shows the proposed land cover in comparison to existing.

- **Park**—The existing commercial development described in Section 1.1, including the building and asphalt parking lot, will be removed and replaced with a new park. The 1.21 acre park will include new paved pathways, a restroom facility, play areas, an updated parking lot, and native vegetation restoration for the remainder of landscape areas. New water service connections and meters will be provided for irrigation and the restroom. The existing sewer service will be capped, abandoned, and replaced with a new service for the park restroom facilities. Stormwater runoff will be collected in a new conveyance system, treated in two newly constructed bioretention cells, and discharged through an existing storm drainage system to outfall to Totem Lake. The proposed stormwater system will include facilities to satisfy the KCSWDM core requirements as discussed in Section 2 of this report.

- **Trail and boardwalk**—The project site also includes an approximately 0.32-acre area of improvements to the existing paved trail and proposed boardwalk. Improvements to the trail include removing, replacing, and widening the existing trail. This new 10-foot-wide trail will account for 0.13 acre of impervious surface. Collecting runoff from this new and existing asphalt pavement is infeasible and instead will sheet-flow down to the lake. Approximately 0.16 acre of wetland and buffer will be overlaid with an open-grated boardwalk. Most of this proposed pervious area (0.13 acre) is within the ordinary high-water elevation of the lake. Runoff from the boardwalk will pass through open space in the decking and drain down to the water and soil below. An additional 0.03 acre of asphalt-paved trail will be added at the end of the proposed boardwalk to connect to the CKC. Runoff from this area will also sheet flow to Totem Lake. The stormwater from the 0.19 acres of area that are sheet flowing to Totem Lake will be substituted (per KCSWDM 1.2.3.2.E, Mitigation of Target Surfaces that Bypass Facility) by runoff from an equivalent area of Totem Lake Way, which will be collected and conveyed to the bioretention cells.

- **Totem Lake Way** – In addition to the 0.19 acres of Totem Lake Way that will be collected as a swap of the trail and boardwalk area, 0.36 acres will be collected from Totem Lake Way and conveyed to the bioretention cells. City of Kirkland staff determined that 0.55 acres from Totem Lake Way can be conveyed to this facility. Of this additional 0.36 acres, 0.14 acres will be detained and treated while the remaining 0.22 acres will be treated for water quality only; this is the maximum amount feasible for flow control given site and sizing constraints. Refer to Section 4 for more information on the modeling used to determine the amount of additional area that could be detained and treated.

Conditions and Requirements Summary

This TIR is intended to fulfill the requirement of a full drainage review by demonstrating compliance with all nine core requirements and all five special requirements as specified in the 2016 KCSWDM as well as City of Kirkland’s Policy D-10 Addendum to the 2016 KCSWDM. The stormwater design will adhere to the requirements in the following codes and standards:

- City of Kirkland Municipal Code, Chapter 90
- 2016 KCSWDM core requirements:
  - Core Requirement 1: Discharge at the Natural Location—There are no exemptions to this requirement; therefore, it will apply to this project. All stormwater runoff from the project under proposed conditions will be discharged through existing infrastructure to an existing outlet location (Totem Lake) and not diverted to or away from any other downstream areas.
  - Core Requirement 2: Offsite Analysis—A Level 1 downstream analysis was performed. Further detail may be found in Section 3 of this TIR.
  - Core Requirement 3: Flow Control—The proposed bioretention cells will mitigate the flow quantity impacts of stormwater runoff from the site as detailed in Section 4 of this report.
  - Core Requirement 4: Conveyance System—A new conveyance system was designed as part of the Totem Lake Park project. The conveyance system will be designed to meet the 25-year conveyance standard with backwater analysis. The new catch basins and storm drains will convey runoff to the proposed bioretention cells, which will then tie into existing outflows into Totem Lake on the south of the project site.
  - Core Requirement 5: Erosion and Sediment Control—There are no exemptions for this requirement; therefore, it will apply to this project. Erosion and sedimentation control (ESC) plans will be included with construction plans, and a Construction Stormwater Pollution Prevention Plan (CSWPPP) will be prepared for the project.
  - Core Requirement 6: Maintenance and Operations—There are no exemptions for this requirement; therefore, it will apply to this project. Maintenance and operations for the site stormwater conveyance and bioretention cells used on this project will be entirely owned, operated, and maintained by the City of Kirkland. Maintenance will follow City of Kirkland Standard Operating Procedures. Sample operations and maintenance information is provided for permitting purposes.
  - Core Requirement 7: Financial Guarantees and Liability—Financial Guarantees and Liability are the responsibility of the City of Kirkland.
  - Core Requirement 8: Water Quality—The project will be exempt from enhanced water quality treatment requirements because there will be less than 5,000 square feet of new plus replaced impervious surface area. The project was evaluated to the basic water quality treatment standard. Water quality measures in the form of two bioretention cells were provided to collect stormwater runoff from the new parking lot onsite as well as from Totem Lake Way.
  - Core Requirement 9: Flow Control Best Management Practices—The new park will have two bioretention cells and a pervious boardwalk designed to meet the standards of KCSWDM Appendix C and subsequent sections of this report.
• 2016 KCSWDM special requirements:

  — **Special Requirement 1: Other Adopted Requirements**—Because the proposed project is located in Kirkland, the following City of Kirkland Storm Drainage Policies apply:

    o **Policy D-3: Targeted and Full Drainage Review Requirements**—The project will create more than 2,000 square feet of new plus replaced impervious surface and is, therefore, subject to a full drainage review by the City of Kirkland Development Services.

    o **Policy D-8: Soil Information for Stormwater Development Requirements**—A soil report has been completed for this site to demonstrate the infeasibility of full dispersion and the feasibility of the selected best management practice (BMP)—bioretention cells and a pervious surfaced boardwalk (AESI 2017).

    o **Policy D-10: Addendum to the 2016 KCSWDM**—The project will follow the design criteria in the KCSWDM.

    o **Policy D-12: Construction Stormwater Pollution Prevention Plan**—A draft CSWPPP will be completed and submitted to the City of Kirkland for this project. The contractor will finalize and modify the plan.

    o **Policy D-13: Wetland Hydrology Study Guidelines**—Part of the project is located within the Totem Lake wetland and its buffer. Mitigation will be considered per Kirkland City Code, Chapter 90.

  — **Special Requirement 2: Flood Hazard Area Delineation**—Type 3 Severe Flooding Problem is not applicable to this project because other projects (past and future) have addressed Totem Lake’s drainage issues.

  — **Special Requirement 3: Flood Protection Facilities**—This project does not rely on or modify any flood protection facilities and will be exempt from this requirement.

  — **Special Requirement 4: Source Control**—This project is a public park development within City-owned property and does not require a commercial building or commercial site development permit; therefore, it is exempt from this requirement.

  — **Special Requirement 5: Oil Control**—This project does not include any high-use site characteristics and is therefore exempt from this requirement.
A Level 1 downstream analysis was performed in accordance with KCSWDM Core Requirement 2 (King County, 2016) to identify and evaluate any potential offsite flooding, erosion, and water quality problems that could be aggravated by the proposed project. The Level 1 downstream analysis is composed of four tasks, defined below. A fifth task addressing mitigation of existing and potential flooding hazards may be added for Level 2 and 3 analyses. Since no existing or potential drainage or water quality problems were identified in the study area that would require mitigation, a Level 1 analysis was completed for this project and is described in this section of the report.

### 3.1 Task 1: Study Area Definition and Maps

According to KCSWDM Section 2.3.1.1 and City of Kirkland Policy D-10, the extent of the full downstream analysis will be completed up to a point where the project site constitutes less than 15 percent of the total tributary drainage area and no less than 0.25 mile downstream of the project site, except for informational review under Task 2, which will extend to a point 1 mile downstream. The study area also will extend upstream as necessary to encompass the offsite drainage area tributary to the project site and to a distance sufficient to preclude any backwater effects from the proposed project.

For this project, the project site is defined as the areas and locations within the larger Totem Lake site that are subject to proposed development. As described in Section 1 of this TIR, the proposed development includes the existing commercial development, trail, and new boardwalk connections around Totem Lake. No offsite drainage areas serve as tributary to these areas constituting the project site that would be subject to backwater effects from the proposed project. The project site also consists of less than 15 percent of the total area tributary to the larger Totem Lake site, and therefore, the full downstream analysis is completed to a point 0.25 mile downstream of the project site. The larger Totem Lake site and associated wetlands and critical areas are analyzed separately in critical areas reports and wetland hydrology studies associated with this project and are not included in the study area.

The beginning point of the downstream study area is the outfall from the southwest corner of the larger Totem Lake site, which is understood to be the confluence of runoff from the project site described above. Stormwater drains from the site outfall through a series of culverts on the north side of Totem Lake Boulevard. The culvert system crosses under Totem Lake Boulevard approximately 1,000 feet downstream and discharges to an unnamed drainage channel between Totem Lake Boulevard and I-405. The channel drains to the northwest to a point 0.25 mile downstream, which defines the endpoint of the full downstream analysis.

From the point 0.25 mile downstream, the channel continues to drain to the northwest between Totem Lake Boulevard and I-405. The channel drains through culverts under I-405 and discharges to a tributary of Juanita Creek. Water flows west in the tributary to a point 1 mile downstream approximately at the east property boundary of Juanita High School, which defines the endpoint of the informational review required for Task 2. The drainage tributary continues to flow west past the 1 mile downstream point and drains into Juanita Creek, which flows southwest and ultimately discharges to Lake Washington. A map of the study area was prepared using a U.S. Geological Survey topographic base map (Appendix C). Task 2: Resource Review

Per KCSWDM Section 2.3.1.1 and City of Kirkland Policy D-10, an informational review will be conducted and extend 1 mile downstream of the project site. The following information was reviewed as part of the analysis:
• **Basin plans**—No adopted basin plans have been developed for the larger Juanita Creek Basin as of the date of this TIR. The following documents were reviewed for general information about the Juanita Creek Basin.

  — *Stormwater Retrofit Analysis and Recommendations for Juanita Creek Basin in the Lake Washington Watershed* (King County, 2012)—This study identifies recommended actions to improve water quality and hydrologic conditions in the Juanita Creek Basin. However, no adopted recommendations or actions within the study area are noted.

  — *Juanita Creek Watershed Report* (City of Kirkland, 2017)—The City of Kirkland summarizes the current conditions of the watershed and recently completed restoration projects. No future restoration activities within the study area are noted.

• **FEMA maps**—FEMA Flood Insurance Rate Maps were reviewed to determine whether parts of the study area exist within a floodplain. No parts of the study area as defined in Task 1 are noted as being mapped within a floodplain. The surrounding area of Totem Lake, including the project site, lies within a Special Flood Hazard Area Zone A, with no base flood elevation determined.

• **Offsite analysis reports**—Other offsite analysis reports were not available for review at the time of this study.

• **Sensitive areas**—The study area was reviewed for sensitive areas on the King County iMap and City of Kirkland geographic information system (GIS) maps. The drainage tributary downstream of I-405 notably flows through a wetland area, beyond the point 0.25 mile downstream of the project site. Sensitive areas around Totem Lake are analyzed under separate reports associated with this project.

• **Drainage complaints**—The following drainage complaints were noted, as provided by City of Kirkland Public Works Department. Further discussion of drainage complaints is provided in Task 4 and Appendix C presents the map depicting the locations of the drainage complaints relative to the study area. These complaints were recorded prior to a culvert improvement project constructed in 2013, which addressed drainage issues associated with capacity constraints and flooding.

  — **SW-05-13 (12636 Totem Lake Boulevard)**—“Standing water in parking lot when it rains — system not draining properly.” (02-24-2005)

  — **SW-06-129 (11217 NE 128th Street)**—“They were worried about the creek flooding the out down at the lower units during the record wet November we had in 2006. The water came within inches of the units. We advised them to use sandbags.” (11-09-2006)

  — **SW-07-62 (11313 NE 128th Street)**—“Beaver dam causing problem for flow.” (07-06-2007)

• **Drainage problems**—No existing drainage problems are noted within the study area. The City of Kirkland’s available engineering records were reviewed to identify any recent projects or improvements in the downstream flow path related to past drainage issues. The following project is noted as a recent improvements:

  — **Record drawing 3592, CIP CSD-0075, JOB NO. 02-13-PW, Totem Lake Twin 42-Inch Culvert Replacement (February 2013)**—This project improved sections of the culvert system along Totem Lake Boulevard with a box culvert between points approximately 0 to 360 feet downstream and 630 to 1,000 feet downstream. The culvert improvements are expected to have addressed previously reported drainage issues at the time of the project. The ordinary high-water mark indicated on the plans is well below the indicated adjacent roadway elevations.

• **Soils survey**—The Natural Resources Conservation Service (NRCS) Web Soil Survey tool (NRCS, 2017) was used to identify soil conditions within the study area. Most of the area between the site outfall to the point 0.25 mile downstream consists of Sk soils (Seattle Muck, Type D), and the majority of
the remaining study area to the point 1 mile downstream consists of EvC soils (Everett Gravelly Sandy Loam, Type A/B).

- **Wetlands inventory**—As noted in review of sensitive areas information, the drainage tributary downstream of I-405 flows through a wetland area, beyond the point 0.25 mile downstream of the project site. No other wetlands are noted in the study area. Totem Lake wetlands, including areas within the project site, are addressed in separate critical areas studies performed as part of this project.

- **Migrating river studies**—No migrating rivers or streams were noted in the study area.

- **Washington State Department of Ecology (Ecology) 303(d) listings**—The Ecology 303(d) list was reviewed to identify any water quality issues within the extents of the downstream analysis. No water quality issues in the study area were noted in 303(d) listings.

- **Designated water-quality problems**—No designated water-quality problems were identified within the study area at the time of this review. The City of Kirkland has rated water quality, streamside vegetation and erosion, and stream flows for Juanita Creek as poor to moderate. However, no specific issues or adopted mitigation plans were identified within the study area. The City of Kirkland addresses water-quality problems through educational programs and source control as described in Policy D-10 Section 1.2.2.1.

- **Adopted stormwater compliance plans**—Apart from the requirements of the 2016 KCSWDM and Policy D-10, no adopted stormwater compliance plans were noted in the study area or larger Juanita Creek Basin.

### 3.2 Task 3: Field Inspection

A field visit was conducted on August 16, 2017, to observe project site surface conditions and downstream drainage features within the study area up to the 0.25-mile downstream point. The weather at the time was partly cloudy, and the most recent recorded rainfall before the field visit occurred on August 13, 2017. The following field observations were noted:

- No reported problems were identified under Task 2 to investigate up to 0.25 mile downstream of the site.
- No observed existing and/or potential issues of flooding, erosion, or water quality issues were identified within the study area at the time of the field visit.
- The drainage culverts and channels, improved in 2013 per record drawing 3592 reviewed in Task 2, appeared to be functioning as designed, and no constrictions or capacity issues were observed.
- The study area topography is relatively flat. Surface conditions above the drainage culverts were largely impervious, and the surface condition of the drainage channel was observed to include tall grass and native vegetation.
- Some culvert outfalls and/or inlets on the north side of Totem Lake Boulevard were located within a construction site and not available for inspection at the time of the field visit.

Photographs from the field visit are included in Appendix C.
3.3 Task 4: Drainage System Description and Problem Descriptions

A general description of the drainage system in the study area is provided in Task 1. Following are the drainage system components from the site outfall to the point 0.25 mile downstream (refer to the study area map and drainage system table in Appendix C):

- **Totem Lake Boulevard drainage culverts**—Several culverts were recently constructed between the project site and a point 1,000 feet downstream of it. These approximately comprise the following:
  - 360 feet of a 3-foot by 8-foot box culvert sloped at 0.2 percent
  - 270 feet of a 5-foot-diameter corrugated metal pipe culvert sloped at 0.5 percent
  - 370 feet of a 3-foot by 8-foot box culvert sloped at 0.2 percent

The 3-foot by 8-foot box culverts were installed in 2013 Kirkland’s record drawing 3592 to address drainage problems with the prior culvert system. The system was observed to be functioning as designed during the field visit, and there were no observed constrictions, capacity issues, or erosion associated with the culverts.

- **Totem Lake Boulevard drainage channel**—The culverts described above discharge to a drainage channel on the south side of the roadway. The channel drains to a point 0.25 mile downstream from the project site. The channel was improved in 2013 to address drainage problems associated with the prior channel as indicated in Kirkland’s record drawing 3592. The improved portions of the channel include a 4-foot-wide bottom area with 2:1 side slopes. The channel was observed to be covered with grass vegetation. The channel was observed to be functioning as designed during the field visit, and no constrictions, capacity issues, or signs of erosion were observed in the channel.

Three drainage complaints were noted in Task 2. These drainage complaints were located beyond the 0.25-mile downstream point but within 1 mile downstream. The following drainage complaints do not indicate problems that could potentially be aggravated by the proposed development:

- **SW-05-13**—The complaint reported standing water in the parking lot of a private development adjacent to the study area in 2005. The parking lot conveyance system appears to connect to the culvert system within the 0.25-mile downstream flow path from the project site per GIS information available on the City of Kirkland’s website. Since the complaint was filed in 2005 and the culvert system was improved in 2013, the backwater issues associated with the culvert system are expected to have been resolved. This complaint does not indicate an existing or potential drainage issue that would require mitigation from this project.

- **SW-06-129**—The complaint reported flooding concerns adjacent to the drainage tributary to Juanita Creek in 2006. The flooding concern appears to be the result of a one-time severe weather event since it was filed only once. The proposed development is anticipated to reduce stormwater volumes through required implementation of low-impact development BMPs per Core Requirement 8, as well as peak-flow reduction through required flow control per Core Requirement 3. Therefore, the project is not anticipated to aggravate potential flooding concerns in the downstream tributary to Juanita Creek.

- **SW-07-62**—The complaint reported flow issues associated with a beaver dam in 2007. The complaint appears to have been a one-time and does not appear to be a consistently reported issue, and the complaint did not indicate any issues associated with flooding. This complaint does not indicate a drainage issue that would be aggravated by the project.
Task 2 indicates that runoff from the drainage area tributary to Juanita Creek flows through a wetland area. This wetland area is beyond the point 0.25 mile, but within 1 mile downstream. Since the project site is within the larger Totem Lake site including associated wetland areas, the project is expected to address potential impacts to wetland hydrology at the project site, and additional mitigation will not be required for downstream wetland areas.
4.1 Existing Site Hydrology

Surface water runoff from the commercial site generally drains from north to south and is collected in an existing storm drain catch basin near the southwest corner of the site. The existing catch basin connects to an existing 24-inch storm drain, which discharges to Totem Lake. Runoff from the existing trail sheet flows down to Totem Lake. Surface runoff from Totem Lake Way, adjacent to the commercial site, drains to a separate storm system that also outfalls to Totem Lake via a separate outlet west of the existing catch basin. The outfall for the roadway is located within the project site and will be protected to remain during construction activities.

According to the geotechnical investigation performed by AESI (2017) as described in Section 1, groundwater was found in multiple exploration borings between 8 and 18 feet below the ground surface, with perched groundwater conditions present above wetland/peat deposits. The level and occurrence of groundwater seepage is expected to change due to factors including changes in season, precipitation, and site use.

4.2 Developed Site Hydrology

The proposed development will include a new conveyance system to collect runoff from the parking lot and other impervious surfaces in the northern portion of the commercial site. Two catch basins will also be added along Totem Lake Way to collect runoff from approximately 0.19 acres of road as a substitute for the 0.19 acres of trail and boardwalk target surfaces that will sheet flow into Totem Lake per KCSWDM 1.2.3.2.E, Mitigation of Target Surfaces that Bypass Facility. Additional catch basins will be added to convey the additional 0.36 acres of Totem Lake Way. These have not yet been designed. This stormwater will be conveyed to the two bioretention cells on the south side of the park site. The treated and overflow runoff will then discharge to Totem Lake via the existing site outfall in a manner that satisfies the conditions and requirements described in Section 2 of this report. Stormwater that falls on the trail and boardwalk is infeasible to collect for mitigation and will generally sheet flow down to Totem Lake. Table 1-1 in Section 1 summarizes proposed project site landcover conditions, and Figure 4-1 shows the proposed land cover conditions and modeling assumptions. Predeveloped conditions, which were also used in modeling, may be found in Figure 4-2. Also, Figure 1-3 in Section 1 depicts the basins within the project site, and Drawing C401 in Appendix A presents proposed stormwater facilities in the park.

4.3 Performance Standards

The following subsections describe the performance standards to be used for flow control, water quality, and conveyance.

4.3.1 Flow Control Facilities

The following performance standards will be met to satisfy Core Requirement 3 per the KCSWDM (2016) according to calculations provided in Appendix D:

**Notes**

¹ KCSWM Section 1.2.3.2.E (Mitigation of Target Surfaces that Bypass Facility)

² KCSWM Section 1.2.9.1.A (Target Surfaces)
The project will meet the standards of conservation flow control areas as described in Section 1.2.3 of the KCSWDM, per the 2017 City of Kirkland Flow Control Map. Criteria and modeling assumptions used to demonstrate compliance include the following:

- Developed project hydrology will match discharge durations to predeveloped conditions for the range of predeveloped discharge rates from 50 percent of the 2-year peak flow up to the full 50-year peak flow.
- Developed project hydrology will also match peak discharge rates to predeveloped peak discharge rates for the 2- and 10-year return periods.
- The predeveloped condition will be modeled as forested land cover, consistent with historical site conditions.
- The predeveloped soil condition will be modeled as saturated wetland soils, consistent with wetland deposits found in geotechnical borings and NRCS soil mapping as discussed in Section 1.

The runoff from the trail and boardwalk will drain directly to Totem Lake via sheet flow; it is infeasible to collect in the proposed drainage system. Rather, KCSWDM Section 1.2.3.2.E was followed for Mitigation of Target Surfaces that Bypass Facility:

1. The point of convergence for runoff discharged from the trail and boardwalk areas and from the bioretention cells are Totem Lake, which is well within a quarter mile of the project site discharge.
2. The increase in existing site conditions 100-year peak discharge from the bypassed area is less than 0.1 cubic feet per second. This was determined with a WWHM 2012 Model of 0.19 acres of impervious surface, modeled with 15-minute timesteps.
3. The target bypassed areas are entirely non-pollution generating impervious surfaces. As such, their drainage will not create a significant adverse impact to downstream drainage systems, salmonid habitat, or properties. See also the Wetland Report (Jacobs, 2018) and number 5 below.
4. There are no water quality requirements applicable to the bypassed target areas. However, the compensatory mitigation area described below will be conveyed to the bioretention cells and therefore will be treated.
5. An equivalent area of Totem Lake Way, which currently drains to Totem Lake, will be substituted for the trail and boardwalk area as compensatory mitigation. Stormwater from this area of Totem Lake Way is currently not mitigated. It will be captured and conveyed to the proposed onsite bioretention cells, which have been designed to accommodate this flow. This has the additional benefit of treating more pollution-generating impervious surface, thus increasing overall water quality to Totem Lake.

The project will evaluate potential impacts to wetland hydrology caused by changes in rate, duration, and quantity of stormwater discharged from the project site to the wetland areas around Totem Lake. The evaluation will be conducted in accordance to Reference 5 of the KCSWDM. An additional Wetland Report will be completed detailing this wetland hydrology study and results; the existing conditions used in this Wetland Study may be found in Figure 4-3.

4.3.2 Flow Control Best Management Practices

Per Core Requirement 9 described in Section 1.2.9 of the KCSWDM, the project will use flow control BMPs to the maximum extent feasible. The proposed park contains two bioretention cells, as seen in design drawings in Appendix A.
Existing Land Cover Summary

Figure 4-3

Existing Area Summary Table (Acres)

<table>
<thead>
<tr>
<th>Category</th>
<th>Acres</th>
</tr>

<tr>
<td>Trail and Boardwalk - Pervious Areas and existing trail to become trail and boardwalk</td>
<td>0.32</td>
</tr>
</tbody>
</table>
Because the site is larger than 22,000 square feet and smaller than 5 acres, Large Lot BMP requirements were met per KCSWDM 1.2.9.2.2. Full dispersion, full infiltration, and limited infiltration are all infeasible at the site. Therefore, the two proposed bioretention cells were used to meet this criterion. The overall park, boardwalk, and trail area is 1.53 acres, of which 0.89 acres (or 58%) is impervious. Per KCSWDM, the Flow Control BMPs are required to be applied to 30% of the impervious site area, or 0.27 acres. As the site is inside the UGA (Rainfall region SeaTac 1.0 and less) with till soils, bioretention volume must be provided based on 0.6 inches of equivalent storage depth, or 590 cubic feet for the 0.27 acres of impervious area. As the bioretention cells have a bottom area of more than 3,200 square feet and a storage depth of 1 foot, they exceed this requirement.

In addition to treating the stormwater runoff, these cells will slow the rate of water flow to Totem Lake. The contributory area to the bioretention cell can be modeled according to Table 1.2.9.A in the KCSWDM. Additionally, the proposed boardwalk will be open-grated, allowing rainfall through to the wetland and buffer area below; this strategy is considered a flow control BMP: “open grid decking over pervious area” and has been modeled as such per Table 1.2.9.A as described in Section 4.4 of this report.

Reduced impervious surface credit and native growth retention credit are not required to be evaluated per Policy D-10.

4.4 Flow Control System

Modeling has been performed for the site using the 2012 Western Washington Hydrology Model (Appendix E includes additional information). Land cover assumptions for modeling are displayed below in Table 4-1 and are consistent with subbasins shown on Figure 1-3. The following assumptions were made regarding modeling:

- Targeted predeveloped site conditions are modeled as historical forested land cover with saturated wetland soils, consistent with wetland soil layers encountered in geotechnical investigations and NRCS soil mapping.
- Proposed site conditions are modeled as saturated wetland soils, which is considered the best representation of hydrologic conditions of the site due to composition of soils (fill over saturated wetland soils) and hydrologic proximity to Totem Lake.
- The Park Basin is assumed to be collected and conveyed to a bioretention cell sized to meet performance standards of Core Requirement 3.
- The Trail & Boardwalk Basin is modeled as an equivalent area of Totem Lake Way as described in section 4.3.1 of this report. Therefore, it is modeled as discharging into the bioretention cells with the same point of compliance as the Park Basin. The modeling credit from the proposed decking over pervious area was maintained in the basin.
- The Trail & Boardwalk Basin also includes the additional 0.36 acres of Totem Lake Way that will be conveyed to the bioretention cells. 0.14 of these additional acres are modeled as C, Forest, MOD in the predeveloped condition, as they will be mitigated by the bioretention cells. The extra 0.22 acres is shown as ROADS MOD in the predeveloped condition. The bioretention cells are not sized to mitigate these 0.22 acres, though they will be conveyed to the existing storm drain with the rest of the onsite stormwater.
- The dimensions used for modeling of the bioretention cell are shown in Table 4-2.
- The two connected bioretention cells are assumed to be modeled as one rectangular cell. The width of this cell was approximated by taking averages shown on design drawings based on bottom area contours.
• The length of the bioretention cell was calculated by taking the combined available bottom area of the cells divided by the approximate width described above.

• The grading slope of the cells varies between 2.5 and 3.0 horizontal/vertical (H/V) around the bioretention cells. The bioretention facilities have the preferred 3:1 slope per COK pre-approved plan for the long slope adjacent to the parking lot but have a modified 2.5:1 slope for the shorter slopes to maximize ponding area. The slopes are planted with a high density of plants, and an erosion control blanket will be added to the 2.5:1 slopes to reduce the chance of erosion of sloughing during plant establishment. Therefore, three sides of the bioretention cell were modeled with a 2.5:1 H/V slope, and a one side was modeled as 2.75:1 slope.

• The depths of the sand and soil layers were determined based on KCSWDM Appendix C guidelines for bioretention cells.

• The gravel depth was determined based on available existing soil depth above groundwater.

• Proposed boardwalk within ordinary high-water mark is excluded from modeling.

• Proposed boardwalk surfaces not over the high-water area is open grid decking over pervious area. This is considered as a flow control BMP used to meet the performance standards of Core Requirement 9 and was modeled as 50-percent impervious and 50-percent lawn per KCSWDM Table 1.2.9.A. Since this area in infeasible to collect, it will drain to Totem Lake. As a substitute, runoff from an equivalent area of Totem Lake Way will be collected and conveyed to the proposed onsite bioretention cells per KCSWDM Section 1.2.3.2.E, Mitigation of Target Surfaces that Bypass Facility.

SMMWW Stormwater Management Manual for Western Washington

### 4.5 Water Quality System

The proposed project contains less than 5,000 square feet of new plus replaced pollution-generating impervious surface and, thus, will not be required to provide water quality treatment per Core Requirement 8 as described in Section 1.2.8 of the KCSWDM. However, the stormwater runoff from the parking lot and from Totem Lake Way will discharge to the bioretention facilities before discharging to Totem Lake and will be treated. The bioretention facilities treat 0.55 acres of Totem Lake Way; of this area, 0.19 acres are an area swap for the trail and boardwalk. Of the remaining 0.36 acres, 0.22 will simply be treated for water quality, while 0.14 will also be detained for flow control.
CONVEYANCE SYSTEM ANALYSIS AND DESIGN

This section describes assumptions and site conditions to justify the conveyance design.

5.1 Existing Storm Drains

The existing stormwater facilities collect and convey water from Totem Lake Park into Totem Lake via a catch basin on the southwest side of the park site. This catch basin will be replaced. Currently, no stormwater facilities are located on the trail or boardwalk sections of the site, because this runoff sheet flows into Totem Lake, the natural discharge location for this site.

5.2 Proposed Storm Drains

The project’s stormwater conveyance facilities will consist primarily of catch basins, underdrain, storm drains, and stormwater facilities used to meet performance requirements listed in Section 4 of this report. The capacity of the new and existing storm drains will be analyzed using uniform flow methods according to KCSWDM Section 4.2.1.2.

Per Core Requirement 4 described in Section 1.2.4 of the KCSWDM, the new storm drain system proposed in Totem Lake Park will collect and convey the full 25-year peak flow from the site, including any conveyance system overflows above the 25-year peak flow. Stormwater from the site and from a portion of Totem Lake Way will be conveyed into the proposed bioretention cells and ultimately to an existing storm drain on the southwest side of the park, which discharges to the natural location for the project site, Totem Lake. The new storm drain system will include new catch basins, 8-inch and 12-inch storm drain pipes, and 6-inch underdrain pipes, as seen on drawing C401 in Appendix A. These pipes have been designed with the capacity to convey, at minimum, the 25-year peak flow, assuming developed conditions for onsite tributary areas and existing conditions for any offsite contributing areas.

Uniform flow conditions will be used to initially size pipes for capacity. Final pipe sizes will be verified using simple backwater analysis. Excel spreadsheets were used in both analyses with the following assumptions:

- **Pipe material**—Smooth wall pipe (PVC and DI) with Manning’s n = 0.014 (uniform)
- **Minimum pipe diameter**—8 inches, with underdrains at 6 inches
- **Minimum cover**—2 feet; if lower cover is needed; class 5 reinforced concrete pipe or ductile iron pipe
- **Minimum velocity**—3 feet per second
- **Match crowns**—At junctions with changes in pipe diameter where possible

Conveyance Calculations and Backwater Analysis are in Appendix F. The project will be designed to use drainage structures from the City of Kirkland’s Standard Plans. In general, Type 1 catch basins will be used. The maximum pipe diameter for Type 1 catch basins is 15 inches, and a maximum of 5 vertical feet will be allowed between the finished grade and the pipe invert.
5.3 Utilities

As noted in Section 1.2 of this TIR, existing storm drains, sanitary sewer, potable water, power, gas, and telephone utilities are located in the park site. Most of these utilities will remain protected in place, with exceptions for the storm drains (noted above) and water and sanitary sewer lines (noted below).

Two new water lines will connect into existing water main under Totem Lake Way for irrigation service and domestic water service for the restrooms. A new sanitary sewer service will also connect to the park’s restroom building. These will convey to a new manhole, and the existing sewer service on the park site will be capped and abandoned, as seen on Drawing C301 in Appendix A.
SECTION 6

Special Reports and Studies

The following report has been prepared for the project at this time:

The following additional reports are currently being prepared, or will be prepared, as part of project design and permitting:

- Critical Areas Report
- Wetland Hydrology Study
7 Other Permits

The following permits or approvals are expected for this project:

- Ecology General Construction Stormwater Permit, Notice of Intent
- City of Kirkland Land Surface Modification Permit
SECTION 8

Construction Stormwater Pollution Prevention Analysis and Design

8.1 Erosion and Sedimentation Control Plan Analysis and Design

An ESC plan will be developed for the final contract plans in accordance with the City of Kirkland Amendment to the KCSWDM and KCSWDM Appendix D. ESC plans are shown on Drawings C201, C202, and C203 in Appendix A.

To avoid erosion and the transport of sediment off site, the contractor will implement temporary control measures during the project’s construction phase. During construction, stormwater runoff will be conveyed in the existing conveyance systems, which are primarily storm drains. ESC measures will be needed to prevent runoff from causing erosion and discharging sediment into the existing drainage system during and after construction. Appropriate ESC measures will be needed for construction activities on existing storm drain systems. The contractor will be responsible for phasing ESC measures so that they are coordinated with staging construction activities. Additionally, the contractor will be responsible for inspecting and maintaining temporary controls during construction, including removing accumulated sediment, and for removing the controls and remaining accumulated sediment at the end of construction.

The project will follow the requirements listed in the National Pollutant Discharge Elimination System General Construction Stormwater Permit. The contractor will prepare a CSWPPP satisfying both the KCSWDM and the City of Kirkland Policy D-12, Construction Storm Water Pollution Prevention Plan. The CSWPPP will be updated as site conditions change.

Permanent measures will be implemented where needed to stabilize disturbed soils at project completion. In accordance with Section 2.3.1.3, City of Kirkland Policies G-7, D-2, and D-3.

8.2 Erosion and Sedimentation Control Measures

The following ESC measures will be provided, as further detailed on ESC plan sheets on Drawings C201, C202 and C203 in Appendix A:

- **Clearing limits** – Clearing limits will be delineated on the construction plans. A silt fence and compost socks will be installed down slope of any fill slopes to prevent offsite sediment migration.

- **Cover measures** – The contractor will provide temporary and permanent cover measures where needed to protect disturbed areas. Mulching will be used in accordance with the KCSWDM’s Appendix D to provide immediate, temporary protection from erosion and to enhance plant growth. Nets and blankets may be used according to KCSWDM Appendix D to provide additional protection and to hold seed and mulch in place on slopes. Disturbed areas will be seeded as a permanent cover measure to reduce erosion.

- **Perimeter protection** – To reduce the transport of sediment off site, the contractor will provide catch basin filters, site fence, and street sweeping as indicated on the final construction drawings and as needed.
• **Traffic area stabilization** – Stabilized construction entrances will be installed at all construction vehicle access locations.

• **Sediment retention** – Catch basin filters (inlet protection) will provide sediment retention at the locations shown on the final construction drawings.

• **Surface water collection** – Surface water control will be provided by using the existing and new drainage conveyance systems. The surrounding area will be protected with silt fences as shown on Drawing C-201 in Appendix A.

• **Dewatering control** – Groundwater is not expected to be encountered during construction, because the site sits at the top of a steep slope, and the soils in the area have high infiltration capacity. If groundwater is encountered during construction, then it may be pumped to an onsite sediment trap or to a catchment created by sandbags with an overflow into a catch basin containing a catch basin insert.

• **Dust control** – If necessary, the contractor will use water according to KCSWDM Section 3.8 to prevent wind transport of soil. Exposed soils will be sprayed until wet and resprayed as needed. When using water for dust control, the contractor will spray exposed soils until they are wet, but runoff should not be generated by spraying. Oil will not be used for dust control. At the contractor’s option, a tackifier may be used with approval from the Engineer and the City of Kirkland.

• **Flow control** – Portable storage tanks are proposed during construction at the southwest portion of the site and will provide sediment retention and possible flow control as needed (see Drawing C-201 in Appendix A). Construction activities will remove and permanently reduce the amount of impervious surface area on the site. Excessive runoff during construction is not anticipated, because the site will be mostly pervious.

• **ESC implementation** – Site development activities relative to ESC concerns will be coordinated and appropriately timed, and protective measures will be inspected, maintained, and updated in a timely fashion. The project will be phased to consider seasonal work limits to the maximum degree practicable. BMPs will be inspected, monitored, and repaired as needed. The site will be inspected and monitored, and the contractor will maintain, update, and implement the CSWPPP in accordance with the Construction Stormwater General Permit and King County requirements. The contractor also will designate a certified ESC lead and provide give his or her name, address, and telephone number to the City of Kirkland before construction begins. The certified ESC lead will be present on site or on-call at all times.

The certified ESC lead will inspect the site at least once a month during the dry season, weekly during the wet season, and within 24 hours of each runoff-producing storm. If the City of Kirkland requires a written record of maintenance activities, a standard ESC maintenance report will be used as a written record of all maintenance. The proposed ESC measures for the project will be further detailed in the final contract plans.

### 8.3 Minimum Erosion and Sedimentation Control Requirements After Construction

Before obtaining final construction approval, the following conditions must be met:

• All disturbed site areas should be vegetated or otherwise permanently stabilized. At a minimum, disturbed areas will be seeded and mulched to provide a high likelihood that sufficient cover will develop shortly after final approval. If seeded during the dry season, then the seeded area will be irrigated as necessary to maintain the sprouted vegetation until the start of the wet season.
• Temporary ESC measures such as silt fences, pipe slope drains, construction entrances, and storm drain inlet protection will be removed.
• All permanent surface water facilities, including catch basins, manholes, pipes, ditches, and channels, will be cleaned of silt and debris.

8.4 Stormwater Pollution Prevention and Spill Control Plan

The contractor will be required to prepare a project CSWPPP in accordance with Policy D-12. Because the project involves ground disturbance of 1 acre or more, the CSWPPP will be prepared in accordance with City of Kirkland requirements.
SECTION 9

9 Bond Quantities, Facility Summaries, and Declaration of Covenant

This section is not applicable; this is a City of Kirkland Public Works Department project to be entirely owned and maintained by the City of Kirkland. As such, a bond quantities worksheet and declaration of covenant are not required for this project. Drawings of the onsite flow control and water quality facilities, the bioretention cells and open-grid decking of the boardwalk, may be found in Appendix A.
As this is a City of Kirkland Public Works Department project, the City of Kirkland will assume all systems operations and maintenance. Recommended preventative Operations and Maintenance Procedures from KCSWDM 2016 for the Bioretention Cells are below. Appendix G contains maintenance solutions based on obstructions or other problems for the control structure, catch basins and manholes, conveyance piping, and the bioretention cells. City of Kirkland Standards shall supersede these procedures where applicable.

### 10.1 Maintenance Restrictions

The size, placement, and design of the bioretention cell as depicted by the flow control BMP site plan and design details must be maintained and may not be changed without written approval either from the King County Water and Land Resources Division or through a future development permit from King County.

Plant materials may be changed to suit tastes, but chemical fertilizers and pesticides must not be used.

### 10.2 Inspection Frequency and Maintenance Guidelines

- Bioretention cells must be inspected annually for physical defects and sediment accumulation.
- After major storm events, the system should be checked to see that the overflow system is working properly, and sedimentation is not occurring at the inlet. If erosion channels or bare spots are evident, they should be stabilized with soil, plant material, mulch, or landscape rock. Sediment deposits should be carefully removed, and the sediment source eliminated.
- A supplemental watering program may be needed the first year to ensure the long-term survival of the bioretention cells' vegetation.
- Chemical fertilizers and pesticides must not be used.
- Mulch may be added, and additional compost should be worked into the soil over time.
- Plant materials may be changed to suit tastes.
- Vegetation should be maintained as follows:
  - replace all dead vegetation as soon as possible;
  - remove fallen leaves and debris as needed;
  - remove all noxious vegetation when discovered;
  - manually weed without herbicides or pesticides;
  - to protect infiltration performance, do not compact soils in the bioretention cell with heavy maintenance equipment and/or excessive foot traffic;
  - during drought conditions, use mulch to prevent excess solar damage and water loss.
10.3 Recording Requirement

These bioretention flow control BMP maintenance and operation instructions must be recorded as an attachment to the required declaration of covenant and grant of easement per Requirement 3 of Section C.1.3.4 of the King County Surface Water Design Manual. The intent of these instructions is to explain to future property owners, the purpose of the BMP and how it must be maintained and operated. These instructions are intended to be a minimum; the King County Department of Permitting and Environmental Services (DPER) may require additional instructions based on site-specific conditions. See King County’s Surface Water Design Manual website for additional information and updates.

10.4 Quantities

Below is a table of the types and quantities of facilities that will need to be maintained on the site.

Flow Control BMP Calculations
Purpose: confirm conformance to KCSWDM Minimum Requirement #9, Flow Control BMPs

1.2.9.2. C Demonstrating compliance with LID performance standard is not required (Less than 5 acres)

1.2.9.2.1 Individual Lot BMP Requirements

Site is >22,000 sf and less than 5 acres: site is a Large Lot

1.2.9.2.2 Large Lot BMP Requirements (in following order)

1. Feasibility and applicability of full dispersion must be evaluated
   Not Feasible

2. Full infiltration of roof runoff
   Not Feasible/Applicable

3. All target impervious surfaces not mitigated by 1 or 2 must by mitigated to MEF by following list
   a. Full infiltration (C.2.2 or C.5.2)
      Not Feasible
   b. Limited infiltration (Appendix C or C.2.3)
      Not Feasible
   c. Bioretention
      i. Inside UGS (rainfall SeaTac 1.0 and less) with till soils → bioretention volume based on 0.6 inches of equivalent storage depth
         Flow Control BMP requirement for areas tributary to bioretention will be met with bioretention
      d. Permeable pavement
         Not implemented: BMP requirement is met with bioretention

4. All target impervious surfaces not mitigated by 1, 2, 3, must be mitigated to MEF using basic dispersion (Appendix C, C.2.4)

   Target impervious surfaces will be mitigated by #3; see #5 below
   Additionally, basic dispersion will be employed to the Maximum Extent Feasible per KCSWDM C.2.9.5, open-grid decking over pervious surface,
   for the boardwalk, which is unable to be conveyed to the bioretention cells

5. BMPs must be implemented at minimum for impervious area amounts:

   Projects resulting in impervious surface coverage of site at 45-65% on buildable portion of the site/lot, flow control BMPs must be applied to 50% of target impervious surfaces reduced by 1.5% for each 1% of impervious surface coverage above 45%

<table>
<thead>
<tr>
<th>AREA (acres)</th>
<th>PERCENTAGE</th>
</tr>
</thead>
<tbody>
<tr>
<td>SITE pervious:</td>
<td>0.81</td>
</tr>
<tr>
<td>SITE impervious:</td>
<td>0.72</td>
</tr>
<tr>
<td>SITE total:</td>
<td>1.53</td>
</tr>
</tbody>
</table>

Impervious coverage of 47% results in requirement of FCBMPs applying to 47% of target impervious surfaces

Target impervious areas to be mitigated (proposed conditions): 0.34 acres = 14,713 sf
Equivalent storage depth = 0.6 inches = 0.05 ft for bioretention inside UGS rainfall per 1.2.9.2.D.3
Minimum required bioretention storage volume: 0.05 ft depth x target impervious area = 736 cubic feet

Bioretention storage volume provided: ~3,760 cubic feet > 736 cubic feet

</thead>
<tbody>
<tr>
<td>Structure</td>
<td>Trash and debris</td>
<td>Trash or debris of more than ½ cubic foot which is located immediately in front of the structure opening or is blocking capacity of the structure by more than 10%.</td>
<td>No Trash or debris blocking or potentially blocking entrance to structure.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Trash or debris in the structure that exceeds 1/3 the depth from the bottom of basin to invert the lowest pipe into or out of the basin.</td>
<td>No trash or debris in the structure.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Deposits of garbage exceeding 1 cubic foot in volume.</td>
<td>No condition present which would attract or support the breeding of insects or rodents.</td>
</tr>
<tr>
<td>Sediment</td>
<td>Sediment exceeds 60% of the depth from the bottom of the structure to the invert of the lowest pipe into or out of the structure or the bottom of the FROP-T section or is within 6 inches of the invert of the lowest pipe into or out of the structure or the bottom of the FROP-T section.</td>
<td></td>
<td>Sump of structure contains no sediment.</td>
</tr>
<tr>
<td>Damage to frame and/or top slab</td>
<td>Corner of frame extends more than ¾ inch past curb face into the street (if applicable).</td>
<td></td>
<td>Frame is even with curb.</td>
</tr>
<tr>
<td></td>
<td>Top slab has holes larger than 2 square inches or cracks wider than ¼ inch.</td>
<td></td>
<td>Top slab is free of holes and cracks.</td>
</tr>
<tr>
<td></td>
<td>Frame not sitting flush on top slab, i.e., separation of more than ¾ inch of the frame from the top slab.</td>
<td></td>
<td>Frame is sitting flush on top slab.</td>
</tr>
<tr>
<td>Cracks in walls or bottom</td>
<td>Cracks wider than ½ inch and longer than 3 feet, any evidence of soil particles entering structure through cracks, or maintenance person judges that structure is unsound.</td>
<td></td>
<td>Structure is sealed and structurally sound.</td>
</tr>
<tr>
<td></td>
<td>Cracks wider than ½ inch and longer than 1 foot at the joint of any inlet/outlet pipe or any evidence of soil particles entering structure through cracks.</td>
<td></td>
<td>No cracks more than ½ inch wide at the joint of inlet/outlet pipe.</td>
</tr>
<tr>
<td>Settlement/ misalignment</td>
<td>Structure has settled more than 1 inch or has rotated more than 2 inches out of alignment.</td>
<td></td>
<td>Basin replaced or repaired to design standards.</td>
</tr>
<tr>
<td>Damaged pipe joints</td>
<td>Cracks wider than ¼-inch at the joint of the inlet/outlet pipes or any evidence of soil entering the structure at the joint of the inlet/outlet pipes.</td>
<td></td>
<td>No cracks more than ¼-inch wide at the joint of inlet/outlet pipes.</td>
</tr>
<tr>
<td>Contaminants and pollution</td>
<td>Any evidence of contaminants or pollution such as oil, gasoline, concrete slurries or paint.</td>
<td></td>
<td>Materials removed and disposed of according to applicable regulations. Source control BMPs implemented if appropriate. No contaminants present other than a surface oil film.</td>
</tr>
<tr>
<td>Ladder rungs missing or unsafe</td>
<td>Ladder is unsafe due to missing rungs, misalignment, rust, cracks, or sharp edges.</td>
<td></td>
<td>Ladder meets design standards and allows maintenance person safe access.</td>
</tr>
<tr>
<td>FROP-T Section</td>
<td>Damage</td>
<td>T section is not securely attached to structure wall and outlet pipe structure should support at least 1,000 lbs of up or down pressure.</td>
<td>T section securely attached to wall and outlet pipe.</td>
</tr>
<tr>
<td></td>
<td>Structure is not in upright position (allow up to 10% from plumb).</td>
<td></td>
<td>Structure in correct position.</td>
</tr>
<tr>
<td></td>
<td>Connections to outlet pipe are not watertight or show signs of deteriorated grout.</td>
<td></td>
<td>Connections to outlet pipe are water tight; structure repaired or replaced and works as designed.</td>
</tr>
<tr>
<td></td>
<td>Any holes—other than designed holes—in the structure.</td>
<td></td>
<td>Structure has no holes other than designed holes.</td>
</tr>
</tbody>

<tbody>
<tr>
<td>Structure</td>
<td>Sediment</td>
<td>Sediment exceeds 60% of the depth from the bottom of the catch basin to the invert of the lowest pipe into or out of the catch basin or is within 6 inches of the invert of the lowest pipe into or out of the catch basin.</td>
<td>Sump of catch basin contains no sediment.</td>
</tr>
<tr>
<td></td>
<td>Trash and debris</td>
<td>Trash or debris of more than ½ cubic foot which is located immediately in front of the catch basin opening or is blocking capacity of the catch basin by more than 10%.</td>
<td>No Trash or debris blocking or potentially blocking entrance to catch basin.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Trash or debris in the catch basin that exceeds ¼ the depth from the bottom of basin to invert the lowest pipe into or out of the basin.</td>
<td>No trash or debris in the catch basin.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Dead animals or vegetation that could generate odors that could cause complaints or dangerous gases (e.g., methane).</td>
<td>No dead animals or vegetation present within catch basin.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Deposits of garbage exceeding 1 cubic foot in volume.</td>
<td>No condition present which would attract or support the breeding of insects or rodents.</td>
</tr>
<tr>
<td>Damage to frame and/or top slab</td>
<td>Corner of frame extends more than ¼ inch past curb face into the street (If applicable).</td>
<td>Frame is even with curb.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Top slab</td>
<td>Top slab has holes larger than 2 square inches or cracks wider than ¼ inch.</td>
<td>Top slab is free of holes and cracks.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Frame not sitting flush on top slab, i.e., separation of more than ¼ inch of the frame from the top slab.</td>
<td>Frame is sitting flush on top slab.</td>
</tr>
<tr>
<td>Cracks in walls or bottom</td>
<td>Cracks wider than ½ inch and longer than 3 feet, any evidence of soil particles entering catch basin through cracks, or maintenance person judges that catch basin is unsound.</td>
<td>Catch basin is sealed and is structurally sound.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Cracks wider than ½ inch and longer than 1 foot at the joint of any inlet/outlet pipe or any evidence of soil particles entering catch basin through cracks.</td>
<td>No cracks more than ¼ inch wide at the joint of inlet/outlet pipe.</td>
<td></td>
</tr>
<tr>
<td>Settlement/ misalignment</td>
<td>Catch basin has settled more than 1 inch or has rotated more than 2 inches out of alignment.</td>
<td>Basin replaced or repaired to design standards.</td>
<td></td>
</tr>
<tr>
<td>Damaged pipe joints</td>
<td>Cracks wider than ½-inch at the joint of the inlet/outlet pipes or any evidence of soil entering the catch basin at the joint of the inlet/outlet pipes.</td>
<td>No cracks more than ¼-inch wide at the joint of inlet/outlet pipes.</td>
<td></td>
</tr>
<tr>
<td>Contaminants and pollution</td>
<td>Any evidence of contaminants or pollution such as oil, gasoline, concrete slurries or paint.</td>
<td>Materials removed and disposed of according to applicable regulations. Source control BMPs implemented if appropriate. No contaminants present other than a surface oil film.</td>
<td></td>
</tr>
<tr>
<td>Inlet/Outlet Pipe</td>
<td>Sediment accumulation</td>
<td>Sediment filling 20% or more of the pipe.</td>
<td>Inlet/outlet pipes clear of sediment.</td>
</tr>
<tr>
<td></td>
<td>Trash and debris</td>
<td>Trash and debris accumulated in inlet/outlet pipes (includes floatables and non-floatables).</td>
<td>No trash or debris in pipes.</td>
</tr>
<tr>
<td></td>
<td>Damaged</td>
<td>Cracks wider than ¼-inch at the joint of the inlet/outlet pipes or any evidence of soil entering at the joints of the inlet/outlet pipes.</td>
<td>No cracks more than ¼-inch wide at the joint of the inlet/outlet pipe.</td>

<tr>
<td>Pipes</td>
<td>Sediment &amp; debris accumulation</td>
<td>Accumulated sediment or debris that exceeds 20% of the diameter of the pipe.</td>
<td>Water flows freely through pipes.</td>
</tr>
<tr>
<td></td>
<td>Vegetation/roots</td>
<td>Vegetation/roots that reduce free movement of water through pipes.</td>
<td>Water flows freely through pipes.</td>
</tr>
<tr>
<td></td>
<td>Contaminants and pollution</td>
<td>Any evidence of contaminants or pollution such as oil, gasoline, concrete slurries or paint.</td>
<td>Materials removed and disposed of according to applicable regulations. Source control BMPs implemented if appropriate. No contaminants present other than a surface oil film.</td>
</tr>
<tr>
<td></td>
<td>Damage to protective coating or corrosion</td>
<td>Protective coating is damaged; rust or corrosion is weakening the structural integrity of any part of pipe.</td>
<td>Pipe repaired or replaced.</td>
</tr>
<tr>
<td></td>
<td>Damaged</td>
<td>Any dent that decreases the cross section area of pipe by more than 20% or is determined to have weakened structural integrity of the pipe.</td>
<td>Pipe repaired or replaced.</td>
</tr>
<tr>
<td>Ditches</td>
<td>Trash and debris</td>
<td>Trash and debris exceeds 1 cubic foot per 1,000 square feet of ditch and slopes.</td>
<td>Trash and debris cleared from ditches.</td>
</tr>
<tr>
<td></td>
<td>Sediment accumulation</td>
<td>Accumulated sediment that exceeds 20% of the design depth.</td>
<td>Ditch cleaned/flushed of all sediment and debris so that it matches design.</td>
</tr>
<tr>
<td></td>
<td>Noxious weeds</td>
<td>Any noxious or nuisance vegetation which may constitute a hazard to County personnel or the public.</td>
<td>Noxious and nuisance vegetation removed according to applicable regulations. No danger of noxious vegetation where County personnel or the public might normally be.</td>
</tr>
<tr>
<td></td>
<td>Contaminants and pollution</td>
<td>Any evidence of contaminants or pollution such as oil, gasoline, concrete slurries or paint.</td>
<td>Materials removed and disposed of according to applicable regulations. Source control BMPs implemented if appropriate. No contaminants present other than a surface oil film.</td>
</tr>
<tr>
<td></td>
<td>Vegetation</td>
<td>Vegetation that reduces free movement of water through ditches.</td>
<td>Water flows freely through ditches.</td>
</tr>
<tr>
<td></td>
<td>Erosion damage to slopes</td>
<td>Any erosion observed on a ditch slope.</td>
<td>Slopes are not eroding.</td>
</tr>
<tr>
<td></td>
<td>Rock lining out of place or missing (If Applicable)</td>
<td>One layer or less of rock exists above native soil area 5 square feet or more, any exposed native soil.</td>
<td>Replace rocks to design standards.</td>
</tr>
<tr>
<td>Maintenance Component</td>
<td>Defect or Problem</td>
<td>Conditions When Maintenance is Needed</td>
<td>Results Expected When Maintenance is Performed</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-----------------------------------</td>
<td>--------------------------------------------------------------------------------------------------------</td>
<td>-------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Preventative</td>
<td>Vegetation</td>
<td>Vegetation to be watered and pruned as needed and mulch applied to a minimum of 2 inches to maintain healthy growth.</td>
<td>Healthy vegetation growth with full coverage as designed.</td>
</tr>
<tr>
<td>Bioretention Area</td>
<td>Trash and debris</td>
<td>Trash and debris in the bioretention area; leaf drop in the fall season.</td>
<td>No trash or debris in the bioretention area.</td>
</tr>
<tr>
<td></td>
<td>Sediment accumulation</td>
<td>Sediment accumulation in the bioretention area interfering with infiltration.</td>
<td>Water in the bioretention infiltrates as designed.</td>
</tr>
<tr>
<td></td>
<td>Ponding</td>
<td>Standing water in the bioretention area for more than two days.</td>
<td>Standing water infiltrates at the desired rate.</td>
</tr>
<tr>
<td></td>
<td>Inflow</td>
<td>Inflow not getting into bioretention; debris/sediment blockage at inlet features; native soil is exposed or other signs of erosion damage is present.</td>
<td>Unobstructed and properly routed inflow into bioretention area; inlet is stabilized and appropriately armored.</td>
</tr>
<tr>
<td></td>
<td>Overflow outlet</td>
<td>Overflow water not controlled by outlet features; native soil is exposed or other signs of erosion damage is present.</td>
<td>Outlet features control overflow; overflow is stabilized and appropriately armored.</td>
</tr>
<tr>
<td></td>
<td>Underdrain</td>
<td>Underdrain is not flowing when bioretention area has been infiltrating water.</td>
<td>Underdrain flows freely when water is present.</td>
</tr>
<tr>
<td>Vegetation</td>
<td>Plant health</td>
<td>Plants not thriving across at least 80% of the entire design vegetated area within the BMP; overly dense vegetation requiring pruning.</td>
<td>Healthy water tolerant plants in bioretention area, plants thriving across at least 80% of the entire design vegetated area within the facility.</td>
</tr>
<tr>
<td></td>
<td>Plant species</td>
<td>Plants not water tolerant species.</td>
<td>Plants are water tolerant.</td>
</tr>
<tr>
<td></td>
<td>Weeds</td>
<td>Weeds growing in bioretention area.</td>
<td>No weeds in bioretention area.</td>
</tr>
<tr>
<td></td>
<td>Watering</td>
<td>Planting schedule requires frequent watering (approx. weekly Year 1, bimonthly Years 2 and 3) for new facilities, and as needed for established plantings or dry periods</td>
<td>Plants are established and thriving</td>
</tr>
<tr>
<td></td>
<td>Pest Control</td>
<td>Signs of pests, such as wilting or chewed leaves or bark, spotting or other indicators; extended ponding period encouraging mosquitoes</td>
<td>Plant community is pest-free when following an approved Integrated Pest Management plan; bioretention functioning normally and ponding controlled as needed for pest control</td>
</tr>
<tr>
<td></td>
<td>Erosion;</td>
<td>Erosion occurring at earthen slopes or containment berm side slope.</td>
<td>Erosion on the containment berm and side slopes has been repaired and the cause of the erosion corrected.</td>
</tr>
<tr>
<td></td>
<td>Voids created by nuisance animals (e.g., rodents) or tree roots</td>
<td>Voids affecting berm integrity or creating leaky pond condition</td>
<td>Voids have been repaired; facility is free of nuisance animals following an approved Integrated Pest Management plan.</td>
</tr>
<tr>
<td></td>
<td>Settlement</td>
<td>Any part of the containment berm top has less than 6 inches of freeboard from the maximum pond level to the top of the berm.</td>
<td>A minimum of 6 inches freeboard from the maximum pond level to the top of the berm.</td>
</tr>
<tr>
<td>Amended Soil</td>
<td>Soil nutrients</td>
<td>Soil not providing plant nutrients.</td>
<td>Soil providing plant nutrients.</td>
</tr>
<tr>
<td></td>
<td>Bare spots</td>
<td>Bare spots on soil in bioretention area.</td>
<td>No bare spots, bioretention area covered with vegetation or mulch mixed into the underlying soil.</td>
</tr>
<tr>
<td></td>
<td>Compaction</td>
<td>Poor infiltration due to soil compaction in the bioretention area.</td>
<td>No soil compaction in the bioretention area.</td>
</tr>
<tr>
<td>Inspection</td>
<td>Frequency</td>
<td>Annually and after large storms, and as needed seasonally for pruning, plant maintenance, pest control and to control leaf drop, evergreen needles etc.</td>
<td>Bioretention facility is functioning normally; plant community is thriving and pest-free.</td>
</tr>

End Date: Click here to enter text.

SWPPP Preparation Date – 08/02/2018

NOTE: Bring the contact information for the CSWPPP Supervisor and the contractor information to the pre-conference.
PROJECT INFORMATION

Description of Site Development:
The project involves the development of 1.53 total acres, summarized in the list below:

- New park consisting of parking lot (5 vehicles), water features, bioretention cells, and landscaped and planting area. The park includes a small building for bathroom facilities.
- Extension of asphalt trail along the north end of the wetlands.
- Boardwalk crossing over a section of wetland area.
- Small stretch of impervious trail on the south edge of the wetland area connecting to the boardwalk.

The park is located on the north side of the Totem Lake Park, outside of the wetland limits. The construction will be within the wetland buffers. Due to the saturated wetland soils, contractor should anticipate challenging conditions in and near wetland areas, where soft soils will be encountered. Part of the trail/board walk will be within the wetland. It is anticipated that wetland soils will not be walkable or drivable, and temporary floatation platform or similar temporary facilities will be needed for access.

Description of Construction Activities:
Construction activities will include site preparation; installation of temporary sedimentation and erosion control measures; clear and grubbing; placement of asphalt and subbase, excavation, pipe installation; building and water tank construction, boardwalk construction, landscaping, and revegetation of disturbed areas.

Overall construction will take place in the proposed sequence as follows:

1. Install ESC measures onsite.
2. Demolish of the existing building and asphalt parking lot.
3. Clear and Grub the existing vegetated areas.
4. General grading and excavation of the park portion.
5. Install utilities including water, sewer, storm, and power.
6. Construct concrete platform, retaining wall, and asphalt parking and trails,
7. Construct park restroom building.
8. Construct boardwalk:
   a. Construction of concrete abutment outside of wetlands at end(s) of the boardwalk.
   b. Clear vegetation by hand along path of the boardwalk, remaining within 12 feet of the boardwalk center alignment. Leave soil, roots, and emergent plants in place.
   c. Lay plywood or other sheet usable as a work surface on already installed pipe pilings.
d. Manually drive a group of 2” diameter piles using power/hand tools approximately 20 feet from the concrete abutment or previous piles whichever is closer.

e. Construct framing and decking in 20 foot segments.

f. Remove work surface from under constructed framing and decking.

g. Repeat steps b through f.

10. Stabilize and vegetate all disturbed area, and remove ESC measures. No materials may be left within the wetland.

Due to the saturated wetland soils, contractor should anticipate challenging conditions in all wetland areas which may require floatation for working surfaces and equipment. The wetland soils will not support construction equipment. If the proposed boardwalk is at or near water inundated zone, step 8c will be refer to a work surface with floatation rather than plywood.

**Critical Areas (wetlands, streams, high erosion risk, steep or difficult to stabilize slopes):** There are no known critical aquifer recharge areas, geologic hazard areas, habitat conservation areas, or other critical areas within the project site or that will be affected by stormwater from the site. Adjacent wetlands would be affected by stormwater discharge from the site.

**List of known impairments for 303(d) listed or Total Maximum Daily Load (TMDL) for the receiving waterbody:** The Water Resources Inventory Area (WRIA) catalogues Washington’s list of 303(d) impaired waters. The project site is within the WRIA Area 8. More specifically, the site lies within the Juanita Creek basin of the Cedar-Sammamish watershed. Downstream of the project site within this sub-watershed appears the following listing on the State’s 303(d) for the following components:

- Category 5, Bacteria, Listing ID 13127
- Category 5, Bacteria, Listing ID 13143
- Category 5, Bacteria, Listing ID 74352
- Category 5, Dissolved Oxygen, Listing ID 12675
- Category 5, Dissolved Oxygen, Listing ID 12686
- Category 5, Dissolved Oxygen, Listing ID 78042
- Category 5, Temperature, Listing ID 4810
- Category 5, Temperature, Listing ID 7027

This project is not anticipated to affect the watershed system related to dissolved oxygen, bacteria, or temperature in any adverse way.
PURPOSE OF THE CSWPPP

This template is a tool for use by developers with project proposals located within the City of Kirkland (COK) for complying with Core Requirement #5 of the 2016 King County Stormwater Design Manual (KCSWDM) and Drainage Policy D-12 of the COK Pre-approved Plans. These rules require the submittal of Construction Stormwater Pollution Prevention Plan (CSWPPP) for review and approval by Kirkland staff.

The CSWPPP contains two parts; the Erosion and Sediment Control (ESC) Plan (required for all projects) and the Stormwater Pollution Prevention and Spill Plan (SWPPP, required for projects of 1 acre or more). Both plans include drawings and reports.
PART A Erosion and Sediment Control (ESC) Measures

The implementation of this ESC plan and the construction, maintenance, replacement, and upgrading of these ESC facilities is the responsibility of the Permittee/Contractor until all construction is approved.

Attach the ESC plan in Appendix A.
1. CLEARING LIMITS (Reference KCSWDM D.2.1.1, p. D-11 for additional information)

Prior to any site clearing or grading, areas to remain undisturbed during project construction shall be delineated on the project's ESC plan and physically marked on the project site. The purpose of clearing limits is to prevent disturbance of those areas of the project site that are not designated for clearing or grading.

**Design & Installation**

*Use the following space to specify how clearing limits are to be delineated, and instructions on their installation.*

Prior to beginning land disturbing activities, including clearing, demolition, and grading, the contractor shall clearly mark all clearing limits and sensitive areas that are to be preserved within the construction. Natural vegetation and native topsoil shall be retained in an undisturbed state to the maximum extent possible.

Construction fence will be installed on the East, North, and West limits of the project area. This fencing will restrict clearing to approved limits and limit construction traffic to designated construction entrances and roads. Silt fence will be placed to mark work zone at the South edge of the site, between the project area and adjacent sidewalk and wetland as shown on the Site Map (Appendix A). Hi-vis fencing will be installed at the limits of clearing along the proposed boardwalk construction in wetland area. No clearing, grubbing, or any demolition activities shall take place outside marked construction limits. Disturbance of wetland areas between boardwalk pile locations should be avoided as possible. The Site Map in Appendix A illustrates the construction limits.

**Maintenance**

*Use the following space to specify maintenance requirements for the clearing limits measures.*

If the fence has been damaged or is no longer clearly visible, it shall be repaired or replaced immediately and visibility restored. Sediment must be removed when the sediment buildup behind the silt fence reaches 6 inches high. To avoid potential erosion and sediment control issues that may cause a violation of the permits, the Certified Erosion and Sediment Control Lead (CESCL) will promptly initiate the implementation of one or more of the alternative BMPs listed in the King County Surface Water Design Manual (KCSWDM) after the first sign that existing BMPs are ineffective or failing.
2. COVER MEASURES (Reference KCSWDM D.2.1.2, p. D-12 and COK Pre-Approved Plans CK-E.05, .06 & .10 for additional information)

Temporary and permanent cover measures shall be provided to protect all disturbed areas, including the faces of cut and fill slopes. The purpose of covering exposed soils is to prevent erosion, thus reducing reliance on less effective methods that remove sediment after it is entrained in runoff.

☒ Surface Roughening (D.2.1.2.1, p. D-13)
☒ Mulching (D.2.1.2.2, p. D-16)
☒ Nets and Blankets (D.2.1.2.3, p. D-18)
☒ Plastic Covering (D.2.1.2.4, p. D-20)
☒ Straw Wattles (D.2.1.2.5, p. D-21)
☒ Temporary and Permanent Seeding (D.2.1.2.6, p. D-24)
☒ Sodding (D.2.1.2.7, p. D-28)
☐ Polyacrylamide for Soil Erosion Protection (D.2.1.2.8, p. D-29)
☐ Compost Blankets (D.2.1.2.9, p. D-31)

Design & Installation

Use the following space to specify the design and installation of cover measures.

| Grading shall be accomplished in such a way that worked soils shall be exposed, graded, and hydroseeded or sodded in phases to limit the amount of time soils are exposed to weather. Additionally, major construction activities shall be scheduled in the dry season (May 1 through September 30) when the least amount of average rainfall is expected. Generally, exposed soils shall be stabilized with the application of effective BMPs to prevent erosion throughout the life of the project. |
| In general, cut and fill slopes will be stabilized as soon as possible and soil stockpiles will be temporarily covered with plastic sheeting. All stockpiled soils shall be stabilized from erosion, protected, and where possible, be located away from storm drain inlets, waterways, and drainage channels. |

Maintenance

Use the following space to specify maintenance requirements for the cover measures.
All cover measures will be inspected and maintained daily and immediately after storm events greater than 0.10 inch of rainfall occur in a 24-hour period. Any areas experiencing erosion will be re-seeded and mulched and/or protected with a net or blanket. All tears or damages must be replaced or repaired.
3. PERIMETER PROTECTION (Reference KCSWDM D.2.1.3, p. D-33 and COK Pre-Approved Plan CK-E.03 for additional information)

Perimeter protection to filter sediment from sheetwash shall be located downslope of all disturbed areas and shall be installed prior to upslope grading. The purpose of perimeter protection is to reduce the amount of sediment transported beyond the disturbed areas of the construction site.

- ☒ Silt Fence (D.2.1.3.1, p. D-33)
- ☐ Brush Barrier (D.2.1.3.2, p. D-36)
- ☐ Vegetated Strip (D.2.1.3.3, p. D-37)
- ☐ Triangular Silt Dike (D.2.1.3.4, p. D-37)
- ☐ Compost Berms (D.2.1.3.5, p. D-38)
- ☒ Compost Socks (D.2.1.3.6, p. D-40)

**Design & Installation**

*Use the following space to specify the design and installation of perimeter protection.*

Silt fence (BMP #) will be placed at the South edge of the site, reducing the transport of coarse sediment from the construction area to the adjacent sidewalk and wetland. Silt fence will also be installed between the concrete abutments at either end of the boardwalk and the adjacent wetland.

Compost socks (BMP #) will be installed between the existing parking lot/restaurant structure and Totem Lake Blvd. They will be installed parallel to the slope, perpendicular to sheet flow from the site down to Totem Lake Blvd. Compost socks will also be installed along the downstream gradient of the proposed trail and boardwalk. Silt fencing and compost socks both reduce transport of sediment by providing a temporary physical barrier to sediment-laden water. They are shown on the Site Map (Appendix A).

**Maintenance**

*Use the following space to specify maintenance requirements for the perimeter protection.*

All installations will be inspected and maintained daily and immediately after storm events greater than 0.10 inch of rainfall occur in a 24-hour period. Any damages shall be repaired immediately. Sediment build-up behind the silt fence must be removed when the sediment is 6 inches high. If filter fabric has deteriorated, it shall be replaced.

When the compost socks are no longer needed, the socks shall be cut open and the compost dispersed to be incorporated into the soil or left on top of the soil for final seeding to occur. The mesh material must be properly disposed. Sediment build-up must be removed when the sediment accumulations are within 3 inches of the top of the sock.
4. TRAFFIC AREA STABILIZATION (Reference KCSWDM D.2.1.4, p. D-41 and COK Pre-Approved Plans CK-E.01 & .02 for additional information)

Unsurfaced entrances, roads, and parking areas used by construction traffic shall be stabilized to minimize erosion and tracking of sediment off site. The purpose of traffic area stabilization is to reduce the amount of sediment transported off site by construction vehicles and to reduce the erosion of areas disturbed by vehicle traffic.

- Stabilized Construction Entrance (D.2.1.4.1, p. D-42)
- Construction Road/Parking Area Stabilization (D.2.1.4.2, p. D-44)
- Wheel Wash (D.2.1.4.3, p. D-45)

**Design & Installation**

*Use the following space to specify the design and installation of traffic area stabilization measures.*

The single construction entrance will be stabilized to reduce the amount of sediment transported onto paved roads by motor vehicles or runoff. Specifically, a geotextile shall be placed on top of the subgrade, and a 12-inch layer quarry spalls will be placed on top of the geotextile. This will be the first step in the clearing and grading process. An HMA curb will be installed on the downstream end of the construction entrance to prevent runoff from leaving the project site.

All construction roads and parking areas will be stabilized for construction traffic usage. Fencing will be installed to limit access to these roads and parking areas.

**Maintenance**

*Use the following space to specify maintenance requirements for the traffic area stabilization measures.*

Quarry spalls shall be added or replaced if the pad is no longer in accordance with the specifications. If the entrance is not preventing sediment from being tracked onto pavement, then alternative measures to keep the streets free of sediment shall be used. This may include street sweeping, an increase in the dimensions of the entrance, or the installation of a wheel wash. Any sediment that is tracked onto pavement shall be removed immediately by sweeping. Any quarry spalls that are loosened from the pad and end up on the roadway shall be removed immediately.
5. SEDIMENT RETENTION (Reference KCSWDM D.2.1.5, p. D-47 and COK Pre-Approved Plans CK-E.08, .09, .09A & .11 for additional information)

Surface water collected from disturbed areas of the site shall be routed through a sediment pond or trap prior to release from the site. The purpose of sediment retention facilities is to remove sediment from runoff generated from disturbed areas.

☐ Sediment Trap (D.2.1.5.1, p. D-48)
☐ Sediment Pond (D.2.1.5.2, p. D-50)
☒ Storm Drain Inlet Protection (D.2.1.5.3, p. D-53)

Monitoring and Sampling Requirements (4.0)

Monitoring includes visual inspection, sampling for water quality parameters of concern, and documentation of the inspection and sampling findings in a site log book. A site log book will be maintained for all on-site construction activities and will include:

- A record of the implementation of the SWPPP and other permit requirements
- Site inspections
- Stormwater sampling data

The site log book must be maintained on-site within reasonable access to the site and be made available upon request to Ecology or the local jurisdiction.

For convenience, the inspection form included in this SWPPP include the required information for the site log book. This SWPPP may function as the site log book if desired, or the forms may be separated and included in a separate site log book. However, if separated, the site log book must be maintained on-site or within reasonable access to the site and be made available upon request.

**Numeric effluent limits may be required for certain discharges to 303(d) listed waterbodies. See CSWGP Special Condition S8.**

Site Inspection (4.1)

Site inspections will be conducted at least once every calendar week and within 24 hours following any discharge from the site. For sites that are temporarily stabilized and inactive, the required frequency is reduced to once per calendar month.

The discharge point(s) are indicated on the Site Map (see Appendix A) and in accordance with the applicable requirements of the CSWGP.

Stormwater Quality Sampling (4.2)

Turbidity Sampling (4.2.1)

Requirements include calibrated turbidity meter or transparency tube to sample site discharges for compliance with the CSWGP. Sampling will be conducted at all discharge points at least once per calendar week.

Method for sampling turbidity:
Table 8 – Turbidity Sampling Method

<table>
<thead>
<tr>
<th></th>
<th>Turbidity Meter/Turbidimeter (required for disturbances 5 acres or greater in size)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Transparency Tube (option for disturbances less than 1 acre and up to 5 acres in size)</td>
</tr>
</tbody>
</table>

Turbidity sampling and monitoring will be conducted during the entire construction phase of the project. Samples will be collected daily at the downstream end of the project area. If there is no flow leaving the work area, the attempt to sample will be recorded in the site log book and reported to Clark County in the monthly Discharge Monitoring Report (DMR) as “No Discharge”. Samples will be analyzed for turbidity using the EPA 180.1 analytical method.

The benchmark for turbidity value is 25 nephelometric turbidity units (NTU). If the discharge’s turbidity is 26 to 249 NTU, the following steps will be conducted:

1. Review the SWPPP for compliance with Special Condition S9. Make appropriate revisions within 7 days of the date the discharge exceeded the benchmark.
2. Immediately begin the process to fully implement and maintain appropriate source control and/or treatment BMPs as soon as possible. Address the problems within 10 days of the date the discharge exceeded the benchmark. If installation of necessary treatment BMPs is not feasible within 10 days, Ecology may approve additional time when the Permittee requests an extension within the initial 10-day response period.

If the turbidity exceeds 250 NTU at any time, the following steps will be conducted:

   - **Central Region** (Benton, Chelan, Douglas, Kittitas, Klickitat, Okanogan, Yakima): (509) 575-2490
   - **Eastern Region** (Adams, Asotin, Columbia, Ferry, Franklin, Garfield, Grant, Lincoln, Pend Oreille, Spokane, Stevens, Walla Walla, Whitman): (509) 329-3400
   - **Northwest Region** (King, Kitsap, Island, San Juan, Skagit, Snohomish, Whatcom): (425) 649-7000
   - **Southwest Region** (Clallam, Clark, Cowlitz, Grays Harbor, Jefferson, Lewis, Mason, Pacific, Pierce, Skamania, Thurston, Wahkiakum): (360) 407-6300
2. Immediately begin the process to fully implement and maintain appropriate source control and/or treatment BMPs as soon as possible. Address the problems within 10 days of the date the discharge exceeded the benchmark. If installation of necessary treatment BMPs is not feasible within 10 days, Ecology may approve additional time when the Permittee requests an extension within the initial 10-day response period.
4. Continue to sample discharges daily until one of the following is true:
   - Turbidity is 25 NTU (or lower).
   - Transparency is 33 cm (or greater).
   - Compliance with the water quality limit for turbidity is achieved.
     - 1 - 5 NTU over background turbidity, if background is less than 50 NTU
     - 1% - 10% over background turbidity, if background is 50 NTU or greater

The discharge stops or is eliminated.

**Design & Installation**

*Use the following space to specify the design and installation of sediment retention measures. Include 2- and 10-year peak flows for the developed conditions. Paste calculations on next page under 'Sizing'.*

| Storm drain inlet protection will be installed to prevent coarse sediment from entering storm drainage systems. However, the first priority is to keep all paved surfaces clean of sediment and separate from entering storm drains until treatment can be provided. |

| Temporary sediment settling tanks will be installed in the Southwest corner of the construction site. Runoff will be directed to a low point on the site with ditches, and pumped to the tanks where sediment will settle out and the water can be discharged to the existing outfall or sanitary sewer system. |

**Maintenance**

*Use the following space to specify maintenance requirements for the clearing limits measures.*

| Inlets shall be inspected weekly at a minimum and daily during storm events. Inlet protection devices shall be cleaned or removed and replaced when sediment has filled one-third of the available storage space. |

| Water captured in the sediment settling tanks will be sampled for turbidity before discharges. Sediment buildup shall be removed from the tank and be disposed off-site when it reaches 12 inches in depth. |
Sizing

In the space below, upload an image of the report from WWHM stating the 2- and 10-year peak flows. The WWHM output is included in Appendix H.

<table>
<thead>
<tr>
<th>Return Period</th>

</tr>
</tbody>
</table>

In the space below, upload calculations showing the sizing requirements.

Sediment Trap sizing per KCSWDM D.2.1.5.1

The surface area of a typical sediment trap = 2 x 0.211/0.00096 = 440 SF.
6. SURFACE WATER COLLECTION (Reference KCSWDM D.2.1.6, p. D-59 and COK Pre-Approved Plan CK-E.07 for additional information)

All surface water from disturbed areas shall be intercepted, conveyed to a sediment pond or trap, and discharged downslope of any disturbed areas. The purpose of surface water control is to collect and convey surface water so that erosion is minimized, and runoff from disturbed areas is treated by a sediment pond or trap.

☐ Interceptor Dike and Swale (D.2.1.6.1, p. D-60)
☐ Subsurface Drains (D.2.1.6.3, p. D-63)
☒ Ditches (D.2.1.6.4, p. D-64)
☐ Outlet Protection (D.2.1.6.5, p. D-66)
☐ Level Spreader (D.2.1.6.6, p. D-66)

**Design & Installation**

*Use the following space to specify the design and installation of surface water collection measures.*

Ditches will be constructed on site to collect and convey surface water runoff to a low point on-site. From this low point water will be pumped to a temporary settling tank(s) or proprietary filtration system to be treated before discharge.

**Maintenance**

*Use the following space to specify maintenance requirements for the surface water collection measures.*

Any sediment deposition of more than 0.5 feet shall be removed so that the channel is restored to its design capacity. If the channel capacity is insufficient for the design flow, it must be determined whether the problem is local or the channel is under-designed. If the problem is local, the channel capacity must be increased through construction of a berm(s) or by excavation. If the problem is under-design, the design engineer shall be notified and the channel redesigned to a more conservative standard to be approved by King County. The channel shall be examined for signs of scouring and erosion of the bed and banks. If scouring or erosion has occurred, affected areas shall be protected by riprap or an erosion control blanket or net.
7. DEWATERING CONTROL (Reference KCSWDM D.2.1.7, p. D-68 for additional information)

The purpose of dewatering control is to prevent the untreated discharge of sediment-laden water from dewatering of utilities, excavated areas, foundations, etc.

☐ Infiltration (D.2.1.7.1.a, p. D-68)
☒ Vehicle transport offsite (D.2.1.7.1.b, p. D-68)
☒ Approved discharge to sanitary sewer (D.2.1.7.1.c, p. D-68)
☐ Sedimentation bags for small volumes of localized dewatering (D.2.1.7.1.d, p. D-68)

Design & Installation

Use the following space to specify the design and installation of dewatering control measures. If not applicable, include language from geotechnical report stating that no groundwater will be present on site. Note if there are contaminated soils on site.

Because the project site is adjacent to a wetland, it is expected that some dewatering may be necessary. Infiltration is not feasible due to the soil conditions and potential high groundwater level. Foundation and trench dewatering water, which have characteristics similar to stormwater runoff at the site, will be pumped from a sump to a temporary sediment settling tank(s) or filtration system prior to discharge. Clean, non-turbid dewatering water will be discharged to the existing outfall to Totem Lake. Turbid water may be discharged to existing sanitary sewer system (with Lakehaven and King County WTD approval) or treated prior to discharge to the storm drains.

Maintenance

Use the following space to specify maintenance requirements for the dewatering control measures.

All pumps used in dewatering shall be repaired immediately if needed. Temporary sediment settling tanks shall be maintained as specified in Element 5. Filtration systems, if used, must be maintained to ensure proper function.
8. DUST CONTROL (Reference KCSWDM D.2.1.8, p. D-69 for additional information)

Preventative measures to minimize the wind transport of soil shall be taken when a traffic hazard may be created or when sediment transported by wind is likely to be deposited in water resources or adjacent properties. The purpose of dust control is to prevent wind transport of dust from exposed soil surfaces onto roadways, drainage ways, and surface waters.

☒ Water
☐ Other from Table D.2.1.8.A (Specify: Click here to enter text.)

Design & Installation

Use the following space to specify the design and installation of dust control measures.

Dust control shall be implemented when exposed soils are dry to the point that wind transport is possible and roadways, drainage ways, or surface waters are likely to be impacted. Dust control measures may consist of chemical, structural, or mechanical methods. When using water for dust control, the exposed soils shall be sprayed until wet, but runoff shall not be generated by spraying.

Maintenance

Use the following space to specify maintenance requirements for the dust control measures.

N/A
9. FLOW CONTROL (Reference KCSWDM D.2.1.9, p. D-71 for additional information)

Surface water from disturbed areas must be routed through the project's onsite flow control facility or other provisions must be made to prevent increases in the existing site conditions 2-year and 10-year runoff peaks discharging from the project site during construction. The purpose of surface water flow control is to mitigate increases in runoff peaks that occur during construction as a result of clearing vegetation, compacting the soil, and adding impervious surface. Such increases can cause or aggravate downstream flooding and erosion.

**Design & Installation**

*Use the following space to specify the design and installation of flow control measures. Include 2- and 10-year peak flows for the developed conditions. Paste calculations on next page under 'Sizing'.*

Surface water flow control shall be installed or otherwise provided prior to any clearing and/or grading of the site, except that required to construct the surface water flow control facilities.

Flow control facilities could be sediment trap(s) or sediment settling tanks. Permanent flow control facilities may not be used for temporary use during construction. The discharge rate of water from the flow control facilities will be controlled to avoid erosion and flooding downstream of the discharge point. The natural hydroperiod of the project adjacent wetland is unlikely to be affected because the project site is significantly smaller than the contributory area of the wetland. Outlet flows will be controlled such that peak discharge from the project site during construction are not greater than the existing site conditions 2-year peak flow; flow frequencies for Totem Lake listed below.

Accounting for the worst case scenario, in which the entire project site is classified as impervious surface during construction, the temporary stormwater detention facilities must total 0.079 acre-ft of storage. This means that two 40ft by 10ft temporary settling tanks will be adequate storage. The WWHM run used for sizing can be found in Appendix H.

**Maintenance**

*Use the following space to specify maintenance requirements for the flow control measures.*

Sediment will be removed before the depth of sediment has accumulated more than 12 inches.

<table>

City of Kirkland, WA
CSWPPP Template – March 14, 2018
10. CONTROL OF POLLUTANTS

The requirements for this section are covered in the Stormwater Pollution Prevention and Spill (SWPPS) Plan, beginning on p. 22 of this document.
11. PROTECT EXISTING AND PROPOSED FLOW CONTROL BMPs (Reference KCSWDM D.2.1.10, p. D-71 for additional information)

Protection measures shall be applied/installed and maintained so as to prevent adverse impacts to existing flow control BMPs and areas of proposed flow control BMPs for the project. The purpose of protecting existing and proposed flow control BMP areas is to avoid sedimentation and soil compaction that would adversely affect infiltration, and also avoid contamination by other pollutants.

Design & Installation

*Use the following space to specify the design and installation of flow control BMP protection measures.*

There is no known existing flow control BMPs on the project site.

Maintenance

*Use the following space to specify maintenance requirements for the flow control BMP protection measures.*

N/A
12. MAINTAIN PROTECTIVE BMPs (Reference KCSWDM D.2.1.11, p. D-72 for additional information)

The purpose of maintaining protective BMPs is to provide continuous erosion and sediment control protection throughout the life of the project, and avoid sedimentation, soil compaction and contamination by other pollutants that would adversely affect infiltration and surface runoff.

**Maintenance**

*Use the following space to specify maintenance requirements for the protective BMPs.*

<table>
<thead>
<tr>
<th>Protection measures shall be monitored per Section D.2.4.4 of the KCSWDM at a minimum, and promptly maintained to fully functioning condition as necessary to assure continued performance of their intended function. The following measures will be used:</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Maintain and repair all temporary and permanent erosion and sediment control BMPs as needed to assure continued performance of their intended function in accordance with BMP specifications.</td>
</tr>
<tr>
<td>2. Remove all temporary erosion and sediment control BMPs prior to final construction approval, or within 30 days after achieving final site stabilization or after the temporary BMPs are no longer needed.</td>
</tr>
<tr>
<td>3. Provide protection to all BMPs installed for the permanent control of stormwater from sediment and compaction. All BMPs that are to remain in place following completion of construction shall be examined and placed in full operating conditions. If sediment enters the BMPs during construction, it shall be removed and the BMP shall be returned to the conditions specified in the construction documents or as required for full BMP replacement.</td>
</tr>
<tr>
<td>4. Remove or stabilize trapped sediment on site. Permanently stabilize disturbed soil resulting from removal of BMPs or vegetation.</td>
</tr>
</tbody>
</table>
13. MANAGE THE PROJECT (Reference KCSWDM D.2.1.12, p. D-72 for additional information)

Coordination and timing of site development activities relative to ESC concerns (Section D.2.4), and timely inspection, maintenance and update of protective measures (Section D.2.3) are necessary to effectively manage the project and assure the success of protective ESC and SWPPS design and implementation.

Projects shall assign a qualified CSWPPP Supervisor (Section D.2.3.1) to be the primary contact for ESC and SWPPS issues and reporting, coordination with subcontractors and implementation of the CSWPPP as a whole.

Measures to Use:

1. Phase development projects to the maximum degree practicable and take into account seasonal work limits.
2. Inspection and monitoring – Inspect, maintain, and repair all BMPs as needed to assure continued performance of their intended function. Conduct site inspections and monitoring in accordance with the Construction Stormwater General Permit and King County requirements.
3. Maintaining an updated CSWPPP – Maintain, update, and implement the CSWPPP in accordance with the Construction Stormwater General Permit and King County requirements.
4. Projects that disturb one or more acres must have, site inspections conducted by a Certified Erosion and Sediment Control Lead (CESCL) (see Section D.2.3.1). Project sites less than one acre (not part of a larger common plan of development or sale) may have a person without CESCL certification conduct inspections. By the initiation of construction, the CSWPPP must identify the CESCL or inspector, who shall be present on-site or on-call at all times.

The CESCL or inspector (project sites less than one acre) must have the skills to assess the:

- Site conditions and construction activities that could impact the quality of stormwater.
- Effectiveness of erosion and sediment control measures used to control the quality of stormwater discharges.
- The CESCL or inspector must examine stormwater visually for the presence of suspended sediment, turbidity, discoloration, and oil sheen. They must evaluate the effectiveness of BMPs and determine if it is necessary to install, maintain, or repair BMPs to improve the quality of stormwater discharges.

Based on the results of the inspection, construction site operators must correct the problems identified by:

- Reviewing the CSWPPP for compliance with all elements and making appropriate revisions within 7 days of the inspection.
- Immediately beginning the process of fully implementing and maintaining appropriate source control and/or treatment BMPs as soon as possible, addressing the problems not later than within 10 days of the inspection. If installation of necessary treatment BMPs is not feasible within 10 days, the construction site operator may request an extension within the initial 10-day response period.
- Documenting BMP implementation and maintenance in the site log book (applies only to sites that have coverage under the Construction Stormwater General Permit).
• The CESCL or inspector must inspect all areas disturbed by construction activities, all BMPs, and all stormwater discharge points at least once every calendar week and within 24 hours of any discharge from the site. (For purposes of this condition, individual discharge events that last more than one day do not require daily inspections. For example, if a stormwater pond discharges continuously over the course of a week, only one inspection is required that week.) The CESCL or inspector may reduce the inspection frequency for temporary stabilized, inactive sites to once every calendar month.
PART B STORMWATER POLLUTION PREVENTION AND SPILL (SWPPS) MEASURES

(Reference KCSWDM D.2.2, p. D-74 for additional information)

The purpose of stormwater pollution prevention and spill control is to prevent, reduce, or eliminate the discharge of pollutants to onsite or adjacent stormwater systems or watercourses from construction-related activities such as materials delivery and storage, onsite equipment fueling and maintenance, demolition of existing buildings and disposition of demolition materials and other waste, and concrete handling, washout and disposal.

The implementation of this SWPPS plan and the construction, maintenance, replacement, and upgrading of the SWPPS facilities is the responsibility of the Permittee/Contractor until all construction is approved.

In the following section, attach the SWPPS plan. See COK General Policy G-7 for plan submittal requirements. The level of detail should be similar to that of COK Pre-Approved Plan CK-E.04.
CONCRETE HANDLING (Reference D.2.2.1, p. D-75 for additional information)

Concrete work can generate process water and slurry that contain fine particles and high pH, both of which can violate water quality standards in the receiving water. Concrete spillage or concrete discharge to surface waters of the State is prohibited. Use this BMP to minimize and eliminate concrete, concrete process water, and concrete slurry from entering waters of the state.

Procedures

Describe the management practices to be employed to prevent concrete washwater from discharging offsite. Specifically identify where you will place unused concrete and how you will prevent washwater or slurry from discharging into storm drain.

The following measures will be used to prevent concrete washwater from discharging offsite:

Assure that washout of concrete trucks, chutes, pumps, and internals is performed at an approved offsite location. Do not wash out concrete trucks onto the ground, or into storm drains, open ditches, streets, or streams.

Return unused concrete remaining in the truck and pump to the originating batch plant for recycling. Do not dump excess concrete on site.

Wash off hand tools including, but not limited to, screeds, shovels, rakes, floats, and trowels into formed areas only. Wash equipment difficult to move, such as concrete pavers in areas that do not directly drain to natural or constructed stormwater conveyances.

If any washdown is done on-site, contain washwater and leftover product in a lined container when no formed areas are available. Dispose of contained concrete in a manner that does not violate ground water or surface water quality standards. Always use forms or solid barriers for concrete pours, such as pilings, within 15-feet of surface waters.
CONCRETE WASHOUT AREA (Reference D.2.2.2, p. D-76 for additional information)

Prevent or reduce the discharge of pollutants to stormwater from concrete waste by conducting washout off-site, or performing on-site washout in a designated area to prevent pollutants from entering surface waters or ground water.

Design and Installation Specifications

If concrete washout is performed on-site, specify the design and installation of the washout containment area(s). Specifically describe the type, size and location on site, and how you will prevent washwater or slurry from discharging into storm drain.

Perform washout of concrete trucks at an approved off-site location. Do not wash out concrete trucks onto the ground, or into storm drains, open ditches, streets, or streams. Do not allow excess concrete to be dumped on-site.

In the event that concrete washout happens on-site, use prefabricated containers resistant to damage and protect against spills and leaks. Locate washout area at least 50 feet from sensitive areas such as storm drains, open ditches, or water bodies, including wetlands.

Maintenance

Prescribe inspection and maintenance schedules and procedures to be conducted on the washout containment area(s). Specifically explain how you will ensure that containers don’t overtop or leak.

Inspect and verify that concrete washout BMPs are in place prior to the commencement of concrete work. During periods of concrete work, inspect daily to verify continued performance. Ensure that condition and capacity are acceptable, and check for leaks.
SAWCutting and surfacIng pollution prevention (Reference D.2.2.3, p. D-81 for additional information)

☐ Check this box if this section is not applicable to the project.

Sawcutting and surfacing operations generate slurry and process water that contains fine particles and high pH (concrete cutting), both of which can violate the water quality standards in the receiving water. Concrete spillage or concrete discharge to surface waters of the State is prohibited. Use this BMP to minimize and eliminate process water and slurry created through sawcutting or surfacing from entering waters of the State.

Procedures

Specify the management practices to be employed to prevent sawcutting and surfacing pollution from discharging offsite. Specifically describe how you will prevent slurry, cuttings or process water from discharging into storm drain.

The following steps will be taken to ensure that slurry, cuttings, or process water are not discharged into waters of the State:

1. Vacuum slurry and cuttings during cutting and surfacing operations. The vacuumed slurry and cuttings will be disposed offsite at an appropriate disposal site.

2. Slurry and cuttings shall not remain on permanent concrete or asphalt pavement overnight.

3. Slurry and cuttings shall not drain to any natural or constructed drainage conveyance including stormwater systems. If required, catch basins will be temporarily blocked.

4. Dispose of collected slurry and cuttings offsite in a manner that does not violate ground water or surface water quality standards.

5. Do not allow process water generated during hydro-demolition, surface roughening or similar operations to drain to any natural or constructed drainage conveyance including stormwater systems. Dispose process water offsite in a manner that does not violate ground water or surface water quality standards.

6. Handle and dispose cleaning waste material and demolition debris offsite in a manner that does not cause contamination of water. Dispose of sweeping material from a pick-up sweeper at an appropriate disposal site.
MATERIAL DELIVERY, STORAGE AND CONTAINMENT (Reference D.2.2.4, p. D-82 for additional information)

☐ Check this box if this section is not applicable to the project.

Prevent, reduce, or eliminate the discharge of pollutants to the stormwater system or watercourses from material delivery and storage. Minimize the storage of hazardous materials on-site, store materials in a designated area, and install secondary containment.

Design and Installation Specifications

Specify the design and installation of measures to protect prevent hazardous materials from discharging offsite. Specifically describe the type, size and location on site of secondary containment and/or cover measures.

Material storage will take place in the construction staging area on the North edge of the project site.

Material Safety Data Sheets (MSDS) should be supplied for all materials stored. Chemicals should be kept in their original labeled containers. Hazardous material storage on-site will be minimized, and hazardous materials will be handled as infrequently as possible.

During wet weather season, hazardous materials will be stored in a covered area.

Chemicals, drums, or bagged materials will be placed on pallets to avoid direct contact with the ground. Drums kept uncovered will be stored with a domed plastic cover to reduce ponding of rainwater on the lids to reduce corrosion.

Horse troughs will be used as secondary containment for hazardous materials being stored on-site.
CONSTRUCTION STORMWATER CHEMICAL TREATMENT (Reference D.2.2.5, p. D-84 for additional information)

☒ Check this box if this section is not applicable to the project.

This BMP applies when using stormwater chemicals in batch treatment or flow-through treatment. Chemical treatment can reliably provide exceptional reductions of turbidity and associated pollutants. Chemical treatment may be required to meet turbidity stormwater discharge requirements, especially when construction is to proceed through the wet season.

**Design and Installation Specifications**

*Specify the design and installation of the chemical treatment system(s) to be employed at the site.*

| It is not anticipated that chemical treatment of construction stormwater will be taking place on this project. |

**Maintenance**

*Prescribe inspection and maintenance schedules and procedures to be conducted on the chemical treatment systems.*

*N/A*
CONSTRUCTION STORMWATER FILTRATION (Reference D.2.2.6, p. D-90 for additional information)

☐ Check this box if filtration will not be used on this project.

Filtration removes sediment from runoff originating from disturbed areas of the site.

Design and Installation Specifications

Specify the design and installation of the filtration system(s) to be employed at the site. Specifically describe the type, size and location on site of stormwater filtration

| A temporary sediment settling tank will be used to filter on-site runoff originating from disturbed areas of the site. See Element 5 of the ESC plan for details. |

Maintenance Standards

Prescribe inspection and maintenance schedules and procedures to be conducted on the filtration system(s).

See Element 5 of the ESC plan for details.
HIGH pH NEUTRALIZATION USING CO₂ (Reference D.2.2.7, p. D-93 for additional information)

☑ Check this box if CO₂ sparging will not be used on this project.

When pH levels in stormwater rise above 8.5 it is necessary to lower the pH levels to the acceptable range of 6.5 to 8.5, this process is called pH neutralization. pH neutralization involves the use of solid or compressed carbon dioxide gas in water requiring neutralization. Neutralized stormwater may be discharged to surface waters under the General Construction NPDES permit.

Design and Installation Specifications

*Specify the design and installation of the CO₂ sparging system to be employed at the site.*

*Specifically describe the type, capacity and location on-site of the sparging system.*

pH CONTROL FOR HIGH pH WATER (Reference D.2.2.8, p. D-96 for additional information)

When pH levels in stormwater rise above 8.5 it is necessary to lower the pH levels to the acceptable range of 6.5 to 8.5, this process is called pH neutralization. Stormwater with pH levels exceeding water quality standards may be treated by infiltration, dispersion in vegetation or compost, pumping to a sanitary sewer, disposal at a permitted concrete batch plant with pH neutralization capabilities, or carbon dioxide sparging (see previous page).

☐ Infiltration
☐ Dispersion
☐ Sanitary Sewer Disposal
☐ Concrete Batch Plant Disposal

Design and Installation Specifications

Specify the design and installation of the pH control system(s) to be employed at the site.

It is not anticipated that pH control for high pH water will be necessary on this project site.

Maintenance Standards

Prescribe inspection and maintenance schedules and procedures to be conducted on the pH control system(s).

N/A
USE OF HIGH pH SOIL AMENDMENTS ON CONSTRUCTION SITES (Reference D.2.2.9, p. D-97 and COK Policy D-16 for additional information)

☒ Check this box if high pH soil amendments will not be used on this site.

Soil amendments used for stability purposes (as described on page D-97) are often high pH and require approval from City of Kirkland before use. Please use the following space to describe how the project will meet the conditions of COK Policy D-16 and Section D.2.2.9.

| N/A |
MAINTAIN PROTECTIVE BMPs (Reference D.2.2.10, p. D-106 for additional information)

Pollutant protection measures shall be maintained to assure continued performance of their intended function. Reporting and documentation shall be kept current and made available to City of Kirkland as indicated.

Maintenance

Describe the procedures required to maintain all pollutant control BMPs.

| 1. Maintain and repair all pollutant control BMPs as needed to assure continued performance of their intended function in accordance with BMP specifications. |
| 2. Maintain and repair storage locations for equipment and materials associated with BMP processes. Conduct materials disposal in compliance with County regulatory requirements. |
| 3. As required, provide current reporting and performance documentation at an accessible location for the site inspector and other DPER staff. |
| 4. Remove all temporary pollutant control BMPs prior to final construction approval, or within 30 days after achieving final site stabilization or after the temporary BMPs are no longer needed. |
MANAGE THE PROJECT (Reference D.2.2.1.1, p. D-107 for additional information)

SWPPS requirements shall be implemented and managed as part of the overall CSWPPP. Concrete construction and its impacts are primary among pollutant concerns on site development projects. Fueling operations and materials containment of treatment chemicals and other project materials are also typical pollutant concerns. Operations that produce these and other pollutants are often conducted by subcontractors and their laborers, yet may require specific protective measures, documentation and reporting. Protective measures and BMPs need to be made available prior to construction and suitable oversight provided to assure inspection, monitoring and documentation requirements are met.

Projects shall assign a qualified CSWPPP Supervisor (Section D.2.3.1) to be the primary contact for SWPPS and ESC issues and reporting, coordination with subcontractors and implementation of the CSWPPP as a whole.

Measures to Use:

1. Phase development projects to the maximum degree practicable and take into account seasonal work limits.
2. Inspection and monitoring – Inspect, maintain, and repair all BMPs as needed to assure continued performance of their intended function. Conduct site inspections and monitoring in accordance with the Construction Stormwater General Permit and King County requirements. Coordinate with subcontractors and laborers to assure the CSWPPP measures are followed.
3. Documentation and reporting: – Inspect, maintain, and repair all BMPs as needed to assure continued performance of their intended function. Document site inspections and monitoring in accordance with the Construction Stormwater General Permit, specific BMP conditions and King County requirements. Log sheets provided in Reference Section 8 may be used if appropriate. Follow reporting requirements and provide documentation as requested to COK staff.
4. Maintaining an updated CSWPPP – Maintain, update, and implement the CSWPPP in accordance with the Construction Stormwater General Permit and King County requirements. Obtain approval for specific CSWPPP measures (e.g., chemical treatments of stormwater) well in advance of need. Coordinate CSWPPP updates with the site inspector (see Section D.2.4.1).
Appendixes

A. Site Map

B. BMP Detail

BMPs can be found in Appendix D of the King County Surface Water Design Manual, found on the King County stormwater documents website at:

C. Correspondence

There is no correspondence expected between Ecology, the EPA, or other governmental agencies.

D. Site Inspection Form

E. Construction Stormwater General Permit (CSWGP)

Download the CSWGP:

https://www.ecology.wa.gov/Regulations-Permits/Permits-certifications/Stormwater-general-permits/Construction-stormwater-permit

F. 303(d) List Waterbodies / TMDL Waterbodies Information

Map attached.

G. Contaminated Site Information

There are no known contaminated sites within the project area.

H. Engineering Calculations

See Attached.
Appendix A
Site Maps
NOTES:
1. REMOVE ALL TREES WITHIN CLEARING LIMIT.
2. A DRAFT SWPPP HAS BEEN PREPARED. CONTRACTOR SHALL OVERSEE THE SWPPP AND THE ESG PLAN AS NEEDED TO REFLECT THE CONSTRUCTION SEQUENCES, MEANS AND METHODS.
3. PROVIDE FINAL SWPPP CONSTRUCTION DRAINAGE AND SEQUENTIAL CONTROL, LEAD, GROUND CONTROL, SUNFLOWER TREATMENT, AND ALL OTHER MEASURES AS NEEDED TO MEET CONSTRUCTION GENERAL PERMIT AND CITY OF KIRKLAND POLICY D.I.5 REQUIREMENTS.
4. THE ESG MEASURES SHOWN ON THIS PLAN AND DESCRIBED IN THE PROJECT SPECIFICATIONS AND MINIMUM REQUIREMENTS FOR ANY PERMITS ISSUED DURING THE CONSTRUCTION PERIOD MUST COMPLY WITH ALL APPLICABLE LOCAL, STATE, AND FEDERAL REGULATIONS.
5. CONTRACTOR SHALL DESIGN TEMPORARY SLOPING.
6. HIGH VISIBILITY FENCE SHALL BE PER WSDOT STANDARD PLAN P11-304.
7. SILT FENCE SHALL BE PER WSDOT STANDARD PLAN E9-104.
8. COMPOST SOCKS SHALL BE PER WSDOT STANDARD PLAN K9-303.
9. PROVIDE CREOSION CONTROL MEASURES FOR ALL UNSTABILIZED AREAS EXCLUDING STATIONS, ACCESS, AND PARKING AREAS BEYOND THE LIMITS SHOWN ON THE PLAN.
10. PLACE CATCH BASIN INSERT IN NEXT DOWNSTREAM INLET IN TREATED AREA.
11. REFER TO SHEET 1020 FOR A DESCRIPTION OF ALLOWABLE IMPACTS.
12. BUFFER AREA (PLUS 1000' HORIZONTAL) MUST INCLUDE SLOPES BELOW THE WATER STORAGE AREA IN THE DRAINAGE CELLS. SHALL BE STABILIZED PER SLOPE STABILIZATION DETAIL 1 ON SHEET C201.

Data Start : 1948/10/01
Data End : 2009/09/30
Precip Scale: 1.00
Version Date: 2018/03/02
Version : 4.2.14

Low Flow Threshold for POC 1 : 50 Percent of the 2 Year

High Flow Threshold for POC 1: 50 year

PREDEVELOPED LAND USE

Name : Basin Park
Bypass: No

GroundWater: No

Pervious Land Use acre
SAT, Lawn, Flat .69

Pervious Total 0.69

Impervious Land Use acre
ROADS FLAT 0.52

Impervious Total 0.52

Basin Total 1.21

Element Flows To:
Surface Interflow Groundwater

MITIGATED LAND USE

Name : Basin Park
Bypass: No

GroundWater: No
Pervious Land Use                  acre
SAT, Lawn, Flat                     .69
Pervious Total                      0.69

Impervious Land Use                acre
ROADS FLAT                           0.52
Impervious Total                    0.52
Basin Total                         1.21

Element Flows To:
Surface     Interflow     Groundwater

ANALYSIS RESULTS

City of Kirkland

ESA Project Number D170506.00
OUR COMMITMENT TO SUSTAINABILITY | ESA helps a variety of public and private sector clients plan and prepare for climate change and emerging regulations that limit GHG emissions. ESA is a registered assessor with the California Climate Action Registry, a Climate Leader, and founding partner for the Climate Registry. ESA is also a corporate member of the U.S. Green Building Council and the Business Council on Climate Change (BCC). Internally, ESA has adopted a Sustainability Vision and Policy Statement and a plan to reduce waste and energy within our operations. This document was produced using recycled paper.

1.0 PROJECT AUTHORIZATION AND SCOPE OF WORK

At the request of the City of Kirkland (City), Environmental Science Associates, Inc. (ESA) delineated wetland boundaries and prepared this technical report for Phase I of the Totem Lake Park Development located in Kirkland, Washington. This report describes the identification and delineation of wetlands on the Phase I study area, as well as a discussion of regulatory implications associated with construction of the proposed project. A conceptual mitigation plan is also included. The purpose of the report is to provide sufficient information to the City and permit agencies about existing wetland functions and potential impacts to facilitate a determination of the permit and mitigation requirements for the proposed project. ESA’s scope of work was limited to wetlands within the project site. Other types of critical areas regulated by the City of Kirkland such as geologic hazard areas are not addressed in this report.

2.0 STUDY AREA AND PROJECT DESCRIPTION

The study area is located within Totem Lake Park, in the northeast portion of the City of Kirkland (Section 28, Township 26N, Range 5E) (Figure 1). It is located within the Juanita Creek basin on the east side of Interstate 405. Totem Lake Park is generally bordered by residential developments to the north and commercial developments to the west, south, and east. Interstate 405 lies approximately 0.2 miles to the west and the Cross Kirkland Corridor Trail (CKC Trail) extends along the southeastern perimeter of the Park.

Totem Lake Park covers 17 acres originally part of the Totem Lake Mall property. In 1973, the mall’s developer donated the land to the King Conservation District (KCD) and the site is currently co-managed by KCD and the City. The City is proposing improvements to Totem Lake Park under a Master Plan. The overall plan aims to integrate the natural setting of Totem Lake with the surrounding urban area. Master Plan elements include but are not limited to: implementation of a trail/boardwalk to form a loop with existing pathways, improved pedestrian and bicyclists connections to the surrounding commercial and residential properties, a new restroom building, limited ADA parking, play area, pedestrian seating and picnic areas, opportunities for public art, and enhancement of the storm drainage and ecological functions of the wetland and surrounding area. There will also be frontage improvements associated with development of the site. The City will implement additional elements from the Master Plan over time as funding becomes available.

This project is Phase 1 of the Master Plan and would construct an approximately 720 linear-foot boardwalk on the eastern and northern portion of the property. The boardwalk will provide a connection between the CKC Trail and the existing foot path on the north side of the park. The proposed boardwalk will have a width of 10 feet and decking will consist of open grating that will allow approximately 25% light penetration. A 43-inch high cable railing will be installed on both sides of the boardwalk. Each railing has an approximate width of 1.5 inches resulting in the boardwalk having a total width of 10.3 feet (Figure 2).
The boardwalk height above the water level will vary throughout the alignment averaging 8 feet above the water surface with the lowest elevations occurring at the boardwalk termini, where the trail transitions to pavement. Estimated elevation over the water level in these areas are 1.3 feet at the northern extent and 5.2 feet at the southern extent. Moving over the lake, inward from these transition areas, the boardwalk gently slopes upward reaching a maximum height of 9.2 feet above the water level (Figure 3). Footings for portions of the boardwalk within the wetland will be 2-inch diameter steel pipe pilings. No mechanized clearing, disturbance of wetland soils, or excavation will occur. Construction of the boardwalk will occur in a sequenced manner using built portions as construction access; all construction equipment will be kept above water levels during the entirety of construction. The boardwalk will occupy approximately 5,592 square feet of Totem Lake Park and will be constructed with open grating to minimize impacts to wetland functions. Removal of existing vegetation will be limited to the maximum extent possible.

Other improvements under Phase 1 include the creation of a play area on the north side of the park (in the former 1.2-acre Yuppie Pawn space). To accommodate the play area, the vacant Yuppie Pawn building will be demolished and replaced with a restroom. The proposed play area will be approximately 31,300 square feet and will include play features such as play structures/equipment and a turf field. Stormwater improvements will also be installed to collect and discharge all stormwater onsite.

Improvements to the existing asphalt path (Totem Lake Path) on the north side of the lake will also occur under Phase 1. The path will be widened to 10-feet and resurfaced to meet standards for accessible design (i.e., ADA standards). In addition to the widening of the path, the area will be graded and a retaining wall will be installed the length of the path. The wall will be backfilled with rocks to facilitate drainage.

Table 1-1 is a summary of elements associated with the Phase 1 park improvements.

<table>
<thead>
<tr>
<th>Project Element</th>
<th>Description</th>
</tr>
</thead>
</table>
| Boardwalk connection between CKC Trail and existing asphalt | Length: 720 linear feet  
Width: 10 feet  
Area: 7,200 square feet  
Decking: Open grate  
Handrail: Yes; metal panel railing at 43 inches height  
Foundation: 2" Steel pipe pilings |
| Widening of existing asphalt path | Width 10 feet  
ADA access: Yes |
| Play area and restroom | Area: 31,300 square feet  
Elements: play structures, synthetic turf area, grass lawn area, native plantings |

*5,500 SF cover the wetland. The remaining 1,608 SF are in the wetland buffer. See Table 6-2 and Figures 7 & 9 for more details.
3.0 METHODS

Two levels of investigation were conducted for the analysis of wetlands in the project vicinity: a review of existing information and an on-site investigation.

3.1 Review of Existing Information

A review of existing literature, maps, and other materials was conducted to identify wetlands or site characteristics indicative of wetlands within the project area. These sources can only indicate the likelihood of the presence of wetlands; actual wetland determinations must be based upon data obtained from field investigations.

Several documents were reviewed:

- *Soil Survey of King County, Washington* (USDA Soil Conservation Service, 1973);
- Existing wetland mapping from the National Wetland Inventory (USFWS, 2018);
- *Hydric Soils of the State of Washington* (Natural Resources Conservation Service, 1995);
- *Web Soil Survey* (Natural Resources Conservation Service, 2017);
- Priority Habitats and Species data (WDFW, 2018);
- Rare plant and vegetation community mapping (WDNR, 2015);
- King County iMAP Interactive Mapping Tool (King County, 2018);
- City of Kirkland Sensitive Area Maps (City of Kirkland, 2017);
- Project information provided by the project landscape architect, The Berger Partnership; and

3.2 On-site Investigation

3.2.1 Determining the Presence of Wetlands and Delineating Wetland Boundaries

The characteristics of an area that result in its classification as “wetland” are defined by federal and state agencies, as described in Appendix A. Numerous federal, state, and local regulations govern development and other activities in or near wetlands; at each level, there are typically several agencies charged with such powers (Ecology, 1994). Specific regulatory implications concerning the subject property are summarized later in this report.
Methods defined in Regional Supplements to the U.S. Army Corps of Engineers (Corps) 1987 Wetlands Delineation Manual (Corps, 2010) were used to determine the presence and extent of wetlands in the study area. The methodology is based upon three essential characteristics of wetlands: (1) hydrophytic vegetation; (2) hydric soils; and (3) wetland hydrology. Field indicators of these three characteristics must all be present in order to determine that an area is a wetland (unless problem areas or atypical situations are encountered).

The “routine on-site determination method” was used to determine the wetland boundaries. The routine method is used for areas equal to or less than 5 acres in size, or for larger areas with relatively homogeneous vegetative, soil, and hydrologic properties.

Formal data plots were established where information regarding each of the three wetland parameters (vegetation, soils, and hydrology) was recorded. This information was used to distinguish wetlands from non-wetlands. If wetlands were determined to be present on the subject property, the wetland boundaries were delineated. Wetland boundaries were identified with sequentially numbered colored flagging imprinted with the words WETLAND DELINEATION or pink colored pin flags. Data plot locations were also marked with colored flagging.

The methods used to assess wetland characteristics are described in greater detail in Appendix A. Please note that common plant names are used throughout this text; the scientific names are presented in Appendix B.

### 3.2.2 Classifying Wetlands

Two classification systems are commonly used to describe wetlands. The hydrogeomorphic (HGM) system describes wetlands in terms of their position in the landscape and the movement of water in the wetland (Brinson, 1993). The U.S. Fish and Wildlife Service classification system (Cowardin et al., 1979) describes wetlands in terms of their vegetation communities; these include, for example, emergent, scrub-shrub, and forested community types.

### 3.2.3 Assessing Wetland Functions

Wetland and streams in the City of Kirkland are regulated under the Kirkland Zoning Code (KZC), Chapter 90 – Critical Areas. Per KZC 90.55.1, wetland functions, and required wetland buffers, are assessed based on the 2014 Department of Ecology (Ecology) Washington State Wetland Rating System for Western Washington (Hruby, 2014). Although this system is designed to rate wetlands, it is based on whether a particular wetland performs a particular function and the relative level to which the function is performed. An assessment of wetland functions is inherent in the rating system. This system was developed by Ecology to differentiate wetlands based on their sensitivity to disturbance, their significance, their rarity, our ability to replace them, and the beneficial functions they provide to society.

Appendix C provides additional information about the Department of Ecology’s rating system wetland categories and the completed rating forms for the project.
4.0 REVIEW OF EXISTING INFORMATION

4.1 Soils

The Natural Resources Conservation Service (NRCS) mapping of soils in the vicinity of Totem Lake Park is shown on Figure 4. The majority of the site is mapped as Seattle muck, a hydric organic soil. Two other hydric soil types are mapped in the vicinity of the proposed project: Kitsap silt loam 2 to 8 percent slopes and Everett very gravelly sandy loam, 8 to 15 percent slopes (NRCS, 2018).

4.2 Wetlands and Streams

The National Wetland Inventory (NWI) identifies a large wetland within Totem Lake Park (the Totem Lake Wetland). NWI maps this wetland as containing emergent, scrub-shrub, forested, and open water elements. Additionally, three small wetlands are mapped in the project vicinity; one on the southwest side of Totem Lake Blvd NE and two on the southeast side of the CKC Trail (Figure 5). These three smaller wetlands are outside of the Phase 1 project area. Other large wetland complexes are mapped approximately 0.3 miles to the west within the Juanita Creek basin.

In addition to the Totem Lake Wetland, the City of Kirkland Sensitive Areas map (2017) shows one stream exiting Totem Lake near the southwest corner, and eventually flowing into Juanita Creek. The majority of this stream is piped from the outlet at Totem Lake to the western side of Interstate 405. An additional stream is mapped as being piped into the wetland from a small wetland feature and ditch on the southern side of the CKC Trail (Figure 5).

A previous wetland reconnaissance investigation identified three wetlands and one stream (Watershed Company, 2013a). The memo also identified restoration opportunities at Totem Lake Park. Information from this memo has been incorporated into this report.

5.0 RESULTS OF FIELD INVESTIGATION

The following sections describe the results of the wetland field investigations conducted by ESA biologists Ilon Logan and Jessica Redman on January 5, 2016, and Jessica Redman and Christina Hersum on June 19, 2017. Field efforts were focused on areas of the park where improvements are proposed and did not include the southern corner of the wetland or the southeast side of the CKC Trail where the previously mentioned stream is located.

5.1 Wetland Delineation

ESA identified one wetland (Wetland A) within the study area during field investigations (Figure 6). Six data plots were established within relatively uniform areas of vegetation on the site. Data plots (DPs) 1 through 4 were established during the January 5, 2016 site visit. DPs 5 and 6 were established during the June 19, 2017 site visit. The results of the functional assessment for Wetland A are presented in Appendix
C, and data sheets for the data plots are provided in Appendix D. Wetland boundaries were flagged by ESA and subsequently surveyed by KPFF, Inc.

**Overview:** Wetland A is a depressional palustrine scrub-shrub and palustrine emergent (PSS/PEM) wetland, approximately 18 acres in size. Totem Lake, an open water feature in the center of Wetland A, is approximately 3 acres and supports a narrow aquatic bed fringe around its edge. DPs 1, 4, and 5 are representative of Wetland A, while plots 2, 3, and 6 characterize the adjacent upland.

**Vegetation:** The majority of Wetland A is a mixture of PSS and PEM plant communities. PSS communities are dominated by willow, red-osier dogwood, and Douglas spirea. PEM communities in the wetland are dominated by common cattail with slough sedge and skunk cabbage present to a lesser extent. A narrow forested area on the northern edge of the wetland is dominated by red alder with an understory of restoration plantings including Sitka spruce and western redcedar. Aquatic bed vegetation in the lake includes pond weed and yellow pond lily.

**Soils:** Soils observed at DP-1 were a very dark grayish brown (10YR 3/2) clay loam in the A (upper) horizon, zero through eight inches below the surface. No redoximorphic features were present in the A horizon. The B horizon (lower) contained a gray (10YR 6/1) sandy loam with 40 percent yellowish brown (10YR 5/8) redoximorphic concentrations in the matrix. The B horizon included soils between eight and eighteen inches below the surface. Soils in DP-1 meet hydric soil criteria F3 (depleted matrix).

Soils at DP-4 and DP-5 were inundated at the time of the site visits. However, hydric soil conditions are likely to occur due to periodic inundation during the growing season, the dominance of hydrophytic vegetation, and best professional judgment.

**Hydrology:** Sources of hydrology to Wetland A include a high groundwater table, precipitation, multiple stormwater inputs, and a seasonal stream on the southern side of the CKC Trail. The outlet of the Wetland A is a partially blocked culvert on its west side, east of 120th Avenue NE and Totem Lake Boulevard NE.

DP-1 was established in the northern portion of the site along the current pedestrian trail. Soils were moist in the lower layers of the plot and the water table was at eighteen inches. As mentioned above, the delineation occurred in early January and out of the growing season. This data plot did not meet wetland hydrology indicators but based on professional judgment, it is likely that soils would be saturated during the growing season, meeting indicator A3. Evidence of this includes the presence of surface ponding approximately ten feet south of the plot, moist soils in the lower layers of the plot, and the presence of wetland soils and hydrophytic vegetation.

DP-4 was established on the east side of the small berm at the southeast corner of the wetland. DP-4 had frozen surface water present that was approximately twelve inches deep meeting wetland hydrology indicator A1 (surface water).

DP-5 was established on the west side of the wetland, near an existing boardwalk. Soils were saturated to the surface and the water table was present at approximately eleven inches.
**Wetland Functions and Classifications:** Using Ecology’s *Washington State Wetland Rating System for Western Washington* (Hruby, 2014), Wetland A received an overall score of 22 points, which qualifies it as a Category II wetland. The wetland scored a moderate to high score (7 points) for water quality improvements. The wetland’s constricted outlet, large cover of vegetation, organic soils, and large area of seasonal ponding all aid in the trapping and filtering of sediments. Wetland A scored a high score (8 points) for hydrologic functions, primarily due to the high depth of storage and constricted outlet than can assist in slowing down and retaining flows during flooding events.

The wetland also scored a moderate to high score (7 points) for habitat function. This is largely due to the diversity in plant communities and hydroperiods. The wetland also contains several special characteristics such as downed wood, snags, structures for egg-laying amphibians, and areas for beaver denning. However, the surrounding landscape has a low potential to support these habitat functions due to the urban nature of the project vicinity.

### 5.2 Wetland Buffer Requirements

Per KZC Chapter 90, the City establishes buffer standards for wetlands based on the wetland category and habitat points. Per KZC 90.55.1, a Category II wetland with six habitat points requires a standard buffer width of 165 feet. The wetland buffer is shown on Figure 6.

The City’s consultant, The Watershed Company, also rated the onsite wetland and also scored the wetland as a Category II wetland. However, their scoring resulted in six, instead of seven habitat points. Per KZC 90.55.1, Category II wetlands with six to seven habitat points require a 165-foot buffer and therefore, the discrepancies have no effect on the buffer width. Both rating forms are included in Appendix C for reference.

### 5.3 Upland and Surrounding Area

Due to the highly developed landscape, upland habitat in the vicinity is highly degraded and buffers are limited for the majority of Wetland A (Figure 6). The north side of the wetland has a narrow upland fringe consisting of deciduous and coniferous trees. Adjacent to this narrow, forested area is a paved pedestrian path and multistory residential developments. The western and southwestern edges of the wetland extend adjacent to the hardscape leaving little buffer between the wetland and retaining walls, sidewalks, and/or roads. The southwest side of the wetland is immediately adjacent to the railroad grade CKC Trail and characterized by railroad fill and little vegetation. The northeast portion of Wetland A contains a connection to a forested corridor along a steep slope. The intact and mature forest along the slope provides some habitat function to wildlife in the area. Beside a few other parks in the vicinity (i.e., within one mile) of Totem Lake Park, the remainder of the surrounding area is developed, leaving these parks the primary resource for habitat and/or stopovers for wildlife in the project vicinity.

### 5.4 Species of Local Importance

An active heron rookery was observed near the former Yuppie Pawn site during the June 19, 2017 site visit. Several young herons were observed in a large black cottonwood tree. The great blue heron is
considered a species of local importance by the City of Kirkland under KZC 90.95(8). This designation may limit tree removal and construction in the vicinity of the rookery during times of nesting and fledging (approximately March through July). However, heron often do not return to the same nest in subsequent years and it is recommended that additional surveys of this tree and others in the study area occur prior to construction to determine the presence or absence of breeding great blue heron.

6.0 PROJECT IMPACTS, MITIGATION SEQUENCING, AND REGULATORY IMPLICATIONS

The proposed improvements at Totem Lake Park may result in direct and indirect wetland and buffer impacts. This section describes the sequence of mitigation taken during project design, the nature of the unavoidable impacts, and potential regulatory implications for the project.

6.1 Mitigation Sequencing and Analysis

The City’s critical areas regulations require the incorporation of mitigation sequencing during project development to evaluate and implementing opportunities to avoid, minimize, eliminate, or compensate for impacts to critical areas while still meeting the objectives of the project. KZC 90.145 outlines the six steps, in order of preference, that must be taken when an alteration to a critical area is proposed. The mitigation steps required by KZC 90.145.2 are listed below, followed by a discussion (in italic text) of how the project has or will meet each step.

A. Avoiding the impact altogether by not taking a certain action or parts of actions;

The project design includes the following measures to avoid impacts to wetlands and their buffers:

- The proposed boardwalk alignment is centered on an existing upland berm in the southeastern portion of the project area (where the boardwalk will connect with the CKC Trail). By taking advantage of this upland feature that extends within Wetland A, the project will reduce overall wetland impacts.

- The proposed boardwalk alignment in the northern portion of the project area (where the boardwalk will connect with the existing Totem Lake Path) was positioned to avoid the removal of large trees and snags.

B. Minimizing impacts by limiting the degree or magnitude of the action and its implementation;

Per KZC 90.40.6.c, public trails in a wetlands and wetland buffers should not exceed five feet in width. The proposed trail improvements would result in a trail with an average width of 10-feet. However, it was concluded that a 10-foot-wide trail is the minimum necessary width to meet the City’s goal of the project being part of a regional transportation improvement effort. An effort that will improve pedestrian and bicyclist connections to the surrounding residential and commercial developments as outlined in the Totem Lake Master Plan.
In 2018, to support the goals and visions of the Master Plan, the City adopted the Totem Lake Urban Center Enhancement and Multimodal Network Plan (Alta, 2018). This document includes several recommendations to “create a livable, walkable, and bikeable district that is a residential and commercial destination for Kirkland residents and visitors from across the region.” One recommendation to achieve this vision includes establishing a continuous and interconnected walking and biking network to be able to safely and conveniently reach destinations within Totem Lake. The recommended width for pedestrian and bicycle shared use trails in the Totem Lake Urban Center is 12 feet. After analyzing anticipated impacts of trail widths ranging from eight to twelve feet, the City decided that a trail width of 10-feet would minimize impacts to critical areas, while still providing a travel area sufficient enough for continuous and safe connections throughout the Totem Lake Urban Center. Trail widths less than ten feet would likely disrupt the flow of bicyclists entering the narrow boardwalk from the wider offsite trails as well as be too narrow to provide a safe route for both pedestrians and bicyclists; while trail widths larger than ten feet would result in additional and unnecessary impacts to critical areas.

To further minimize the degree or magnitude of unavoidable impacts to wetland and their buffers, the project design includes the following measures:

- Within wetland areas, the project proposes to mount the boardwalk on 2-inch diameter steel pipe pile foundations, which minimizes disturbance to sediment, hydrology, and circulation, resulting in no adverse alteration to aquatic functions.
- Construction of the boardwalk will occur in a sequenced manner using built portions as construction access and all construction equipment will be kept above water levels during the entirety of construction.
- Boardwalk framing and decking materials have been selected for the ability to be installed with small equipment (or by hand) to avoid impacts.
- The proposed decking of the boardwalk has been selected for the ability to allow light penetration, which will allow sunlight to reach existing vegetation under the boardwalk and preserve wetland functions. The grated decking will allow 25% of light to penetrate the ground surface.
- Any vegetation that requires clearing for boardwalk construction will be cut by hand and flush to the water surface and/or to the least extent possible.
- Boardwalk decking and pervious materials have been proposed for the trail alignment within the buffer to the extent feasible.
- Appropriate best management practices (BMPs) will be employed to reduce sedimentation and erosion and to minimize the chance of contaminant spills during project construction as described in Section 6.3.
C. Rectifying the impact by repairing, rehabilitating, or restoring the affected environment;

*The project design includes the following measures to rectify any proposed impacts:*

- The proposed boardwalk will consist of open decking approximately 6 feet above the water surface that will allow 25% light penetration. Because of these design features, it is anticipated that any vegetation that will need to be cut during boardwalk construction will continue to grow post-construction.
- Areas of unavoidable wetland buffer impacts caused by construction will be restored and revegetated with native plants, post-construction.
- Stormwater improvements proposed at the play area will treat stormwater runoff in bioretention cells which will reduce the peak flow and duration to the wetland as well as improve the water quality of the runoff to the wetland.

D. Reducing or eliminating the impact over time by preservation and maintenance operations during the life of the action;

*This project proposes mitigation for permanent indirect impacts to the wetland and permanent direct impacts to the wetland buffer through wetland and buffer enhancements as detailed in Section 7.0 and the forthcoming Final Mitigation Plan. These enhancements will be protected over time through maintenance activities and ensuring boundaries are clear to prevent human disturbance.*

E. Compensating for the impact by replacing or providing substitute resources or environments; and/or

*The project proposes mitigation for unavoidable wetland and wetland buffer impacts through buffer enhancements as detailed in Section 7.0 and the forthcoming Final Mitigation Plan. Temporary impacts due to construction will be restored and revegetated with native plants, post-construction.*

F. Monitoring the impact and the compensation projects and taking appropriate corrective measures.

*The proposed mitigation plan includes a 5-year Monitoring and Maintenance Plan for all proposed mitigation per KZC 90.160 (See Section 7.5 and 7.6).*
6.1.1 Standard Mitigation Measures

Standard mitigation measures as outlined in KZC 90.155 will be implemented onsite, as needed, to further reduce the risk of impacts to critical areas. These measures are summarized in Table 6-1.

<table>
<thead>
<tr>
<th>Disturbance</th>
<th>Measures Taken to Minimize Impacts</th>
</tr>

<tr>
<td>Change in Water Regime</td>
<td>The proposed project will not result in a change in water regime and therefore, no long-term mitigation measures are necessary.</td>
</tr>
<tr>
<td>Pets and Human Disturbance</td>
<td>During construction, silt fencing will be installed along the edge of the wetland to minimize any adverse impacts to the wetland. Post-construction, permanent fence and signage will be installed along the edge of the buffer, per KZC 90.190</td>
</tr>
<tr>
<td>Dust</td>
<td>Best management practices to control fugitive dust will be implemented as needed, including spraying exposed soil and storage areas with water during dry periods. Post construction, the project will result in landscaped areas and play areas that will not generate dust and therefore, no long-term mitigation measures are necessary.</td>
</tr>
</tbody>
</table>

6.1.2 Construction BMPs

Appropriate BMPs will be used for pollution, sediment, and erosion control during construction. Erosion and sediment control measures may include mulching, matting, and netting; filter fabric fencing; quarry rock entrance mats; sediment traps and ponds; and surface water interceptor swales and ditches. Significant long-term water quality impacts are not expected if erosion control BMPs, stormwater treatment facilities, and spill containment measures are properly implemented, monitored, and maintained during construction. A Temporary Erosion and Sediment Control (TESC) plan has been prepared and implemented to minimize and control pollution and erosion from stormwater. The project will adhere to a Spill Prevention Control and Countermeasure (SPCC) plan developed specifically for construction.

6.2 Wetland and Buffer Impacts

The proposed boardwalk will extend approximately 720 linear feet from the existing Totem Lake Path, south across the edge of Wetland A, and then connect with the existing CKC Trail at its southern extent. Construction of the boardwalk will result in indirect impacts to Wetland A, and direct and indirect impacts to its buffer as summarized in Table 6-2 and described in the following sections. All anticipated
impacts are shown in Figure 7. Detail of the park, trail, and boardwalk based on 100% design are shown in Figure 8.

*Calculations include all impervious surface areas post-construction, including areas covered with impervious surface pre-construction.

The construction of the bioretention stormwater facilities will also occur within the former Yuppie Pawn site and in the buffer of Wetland A (Figure 8a). However, the entirety of the bioretention area will be planted with multi-structural native vegetation and will result in a functional lift to the site and therefore, will offset the impacts in this area, and be considered buffer enhancement. Details are included in Section 7.

The majority of this area is currently an asphalt parking lot and will have less impervious surface post-construction than in its current state. In total, the amount of impervious surface at the former Yuppie Pawn site pre- and post-construction will be reduced from 36,934 SF (0.9 acre) to 23,874 SF (0.6 acre), a difference of 13,060 SF (0.3 acre).

## 6.2.1 Wetland Impacts

Once complete, the park, boardwalk and trail improvements will cover approximately 49,667 SF of wetland and wetland buffer (Figure 7 and Table 6-2). As noted above in Section 6.1, the boardwalk will be mounted on pipe pile foundations and will be placed in a sequenced manner to avoid direct impacts to the wetland. This includes adverse changes in water quality, hydrologic function, or habitat function of the wetland.
The boardwalk will average approximately 8 feet above the wetland, which may result in indirect impacts to the wetland due to the shading of vegetation (Table 6-2). In areas where the boardwalk is higher, long-term shading impacts are anticipated to be minimal and vegetation is expected to return within one growing season of boardwalk construction. In addition, the proposed decking will allow 25% light penetration, which will further reduce the impact of shading overall.

One dead, deciduous tree will be removed from the wetland near the northern extent of the boardwalk, where it transitions from the wetland into the wetland buffer. The tree will be cut approximately one foot above existing grade and roots will remain. The removed trunks will be used as a habitat feature and will remain onsite within the wetland or wetland buffer.

To accommodate boardwalk construction, vegetation will be cleared in a maximum 22-foot-wide corridor along the boardwalk alignment. Vegetation will be cut by hand and flush to the water surface. Temporary impacts to wetland vegetation may occur where existing vegetation needs to be trimmed for boardwalk construction (Figure 7 and Table 6-2). These temporary impacts are limited to six feet on either side of the boardwalk. It is expected that vegetation damaged during construction would regrow in the following growing season and changes in the plant community between pre- to post-construction are not anticipated. The City will revisit the site during the next growing season and assess that these temporary impacts have returned to a healthy state. If the plantings are not returning, the City will provide recommendations on how to remediate the areas.

6.2.2 Buffer Impacts

Trail and Boardwalk Impacts

The proposed project will result in permanent wetland buffer impacts where the boardwalk will tie into the existing Totem Lake Path at its northern terminus, and where the alignment travels the upland berm and ties into the CKC Trail at its southern terminus (Figure 8b). The boardwalk alignment and footprint is designed to avoid existing vegetation in the wetland buffer to the extent possible. Installation of the approach ramps at either end of the boardwalk and the portion of the alignment along the upland berm will require some vegetation removal. Vegetation that will be impacted in these areas consists of native shrubs and trees, primarily young red alder and red-osier dogwood, and Himalayan blackberry. Larger trees in these areas will be retained.

Installation of the approach ramps at either end of the boardwalk and the boardwalk alignment along the upland berm will impact wetland buffer at the northern and southern ends (Figure 7 and Table 6-2). The approach ramps will be constructed of the same materials as the overwater portion of the boardwalk and will result in shading impacts to the wetland buffer. Additional temporary impacts will occur during construction at the northern and southern termini of the boardwalk. However, these areas will be restored, post-construction, through the planting of native trees and shrubs.

In addition to shading impacts, wetland buffer adjacent to the southern ramp will be permanently impacted by new asphalt paving and two concrete abutments associated with the transition from existing path to boardwalk. Similar to the asphalt trail to the north, a retaining wall will be installed on either side of this portion of the trail, and backfilled with rocks at the southern end. Finally, permanent buffer impacts will occur through widening and repaving the existing asphalt path to the north, as well as
installing the retaining wall and fill rocks. (Table 6-2 and Figures 7 and 8c). Similar to the area of the detention ponds, because this area will be graded to such an extent as to support the new ADA trail, this entire area is being included in buffer calculations even though portions of it are currently covered with impervious surface.

Three black cottonwood trees will be removed from the buffer near the northern portion of Wetland A. These trees are known to be prone to disease and could create hazardous situations and injuries. The City has proposed removal of these trees to prevent injuries to pedestrians and damage to the boardwalk. The City will replace these trees with species that do not grow as large, to reduce the risk of pedestrians being struck by large limbs.

**Play Area Impacts**

Development of the play area, associated parking and landscaping will also result in permanent impacts to the buffer of Wetland A. The majority of these impacts are areas of impervious surface including the play area, restroom, walking paths and parking. The remaining permanent impacts are areas of the proposed play field that will be planted with non-native grasses (Table 6-2 and Figures 7 and 8d).

The remaining area of the former Yuppie Pawn site will be planted with multi-structural native vegetation, and therefore, are not calculated as buffer impact areas, but as buffer enhancement areas. (Table 6-2 and Figure 7). More detail of the buffer enhancement area can be found in Section 7.2

**Additional Buffer Impacts**

A maximum of 96 significant trees (greater than 6-inches in diameter at breast height per KZC 5.10.855) will be removed from the buffer of Wetland A. Sixty-eight of these trees are within the former Yuppie Pawn site. The trees will be removed due to one or more of the following reasons: poor health, conflict with proposed grading, or impacts associated with the demolition of the vacant Yuppie Pawn building. The majority of the trees proposed for removal along the trail have been recommended for removal by the project’s arborist (See tree plans and arborist reports in Appendix E). Several of these include non-native red maple street trees and ornamental plum and cherry trees (STC, 2017). The boardwalk and trail improvements were designed to largely avoid significant tree removal. Other vegetation that will be impacted in these areas consists of native shrubs and small trees, primarily young red alder and red-osier dogwood.

All tree removal will follow requirements in KZC 95.30 – Tree Retention Associated with Development Activities, and KZC 90.135 – Trees in Critical Areas and Critical Area Buffer. Trees may be girdled when necessary to manage regrowth in close proximity to the trail, boardwalk, and park. Removed trees will be used as habitat features onsite to the extent possible. Trees removed from the buffer will be replaced with one to three native trees per KZC 90.135.1 as determined by the City’s Planning Official. Currently 188 trees are being proposed to replace the 96 trees that are being removed, or a replacement ratio of 1.96:1 (replacement : removal ratio).

Temporary buffer impacts may also result from construction activities and equipment staging. As mentioned above, buffers at the northern and southern termini of the boardwalk will be temporarily impacted during construction (Table 6-2, Section 7, and Figure 7). If additional temporary wetland buffer
impacts occur as the result of construction activities and equipment staging, the buffer will be returned to at least its pre-construction condition through the planting of native trees and shrubs after park construction.

6.3 Regulatory Implications

Wetlands are regulated by Corps, Ecology, and the City of Kirkland. At a federal level, the Corps regulates wetlands and streams (i.e., defined as waters of the U.S.) under the Clean Water Act, and projects that propose the excavation or fill of these features require a Section 404 permit. Wetlands are also regulated under Section 401 of the Clean Water Act, which is administered by Ecology. Ecology must issue a Water Quality Certification (WQC) for the project and ensure that the project is consistent with the Federal Coastal Zone Management Act (CZMA). The WQC and CZMA consistency determination are triggered by the Section 404 permit.

The footings for portions of the boardwalk within Wetland A will be 2-inch diameter pipe pilings. Placement of these pilings will not impair the flow and circulation of the waterbody or result in the adverse alteration of aquatic functions. No excavation, disturbance of wetland soils, or mechanized clearing will occur. Construction of the boardwalk will occur in a sequenced manner using built portions as construction access and all construction equipment will be kept above water levels during the entirety of construction. The Corps was consulted for the proposed project and concluded that the boardwalk materials are not be considered fill and thus no Section 404 permit under the Clean Water Act is required for project construction (Corps correspondence, December 2017).

The Washington Department of Fish and Wildlife (WDFW) also regulates activities in state waters such as streams and lakes. Specifically, they must review, condition, and approve or deny “any construction activity that will use, divert, obstruct, or change the bed or flow of State waters.” Any project that requires in-stream or in-lake work would require a Hydraulic Project Approval (HPA) from WDFW. Thus, construction of the proposed boardwalk will require an HPA.

At a local level, wetland and buffer impacts are regulated by the City of Kirkland and the proposed project will require review and approval according to KZC Chapter 90—Critical Areas. The proposed park and boardwalk are not an allowed use of the wetland and wetland buffer according to KZC 90.40.6. However, per the City Planning Department, the proposed impacts may be permitted under a Public Agency and Public Utility Exception (KZC 90.45). Per 90.45.3, the project must meet four specific decisional criteria for the exception to be approved. These criteria are listed below, followed by a discussion (in italic text) of how the proposed project meets each criterion. Based on the following justification, the project appears to be eligible for the Public Agency and Public Utility Exception.

a) There is no other practical alternative to the proposed project with less impact on the critical areas of buffer;

*The project has been designed to avoid critical areas to the extent possible, while still meeting the goals of the Totem Lake Master Plan. The boardwalk and trail design have applied the appropriate mitigation sequencing to ensure that long-term adverse effects to critical areas are minimized and avoided to the extent possible as discussed in Section 6.1.*
The proposed mitigation discussed in Section 7.0 will ensure that no loss of ecological functions will occur post-construction, due to unavoidable, indirect impacts to the wetland and wetland buffer.

b) Strict application of this chapter would unreasonably restrict or prohibit the ability to provide public utilities or public agency services to the public;

Strict application of KZC Chapter 90 would prohibit the construction of a trail through the onsite wetland and wetland buffer, resulting in the City’s Department of Parks and Community Service’s inability to fulfill the goals of the Totem Lake Master Plan and part of the adopted City of Kirkland’s Comprehensive Plan.

c) The proposal minimizes impacts to the critical area or buffer through mitigation sequencing, and through type and location of mitigation, pursuant to KZC 90.145 and 90.150 if applicable, including such installation measures as locating facilities in previously disturbed areas, boring rather than trenching, and using pervious or other low impact materials; and

The proposed project minimizes impacts to critical areas and buffers through mitigation sequencing and minimization measures per KZC 90.145 as discussed in Sections 6.1 and 6.2 of this report, respectively.

d) The proposal protects and/or enhances critical area and buffer functions and values, consistent with the best available science and with the objective of no net loss of critical area functions and values.

As mentioned above, the project has been designed to avoid critical areas to the extent possible, while still meeting the goals of the Totem Lake Master Plan. No direct wetland impacts are proposed. To ensure a no net loss of function, the project will mitigate for all direct and indirect buffer functions and all indirect wetland functions. Portions of the wetland and wetland buffer chosen for enhancement will be ecologically functioning at a higher level, when compared to current conditions. The conceptual mitigation plan detailed in Section 7.0 has been designed using the best available science guidance in Wetland Mitigation in Washington State Part 1: Agency Policies and Guidelines (Ecology et al., 2006).

7.0 CONCEPTUAL MITIGATION PLAN

The following section describes a conceptual mitigation approach to compensation for impacts to wetlands as required by step “E” in the City’s mitigation sequence (described previously in Section 6.1) and KZC 90.145.6 – Mitigation Plan Standards.
7.1 Compensatory Wetland Mitigation Requirements and Approach

The City Planning Department has determined that the indirect impacts to Wetland A due to shading will result in a loss of wetland function, and that compensatory mitigation would be required.

Mitigation approaches for indirect wetland impacts typically focus on improving the water quality, hydrologic, and wildlife habitat functions of a given wetland. For Wetland A, the installation of the boardwalk is not anticipated to change the water quality and hydrologic functions of the wetland. However, habitat functions of the wetland are currently compromised by the highly urbanized location and thus compensatory mitigation should focus on providing a lift to the habitat functions of the wetland.

Approaches to mitigation that will provide a habitat functional lift include:

- Removing invasive vegetation and refuse from the wetland; and
- Enhancement of wetland through the planting of native trees and shrubs, primarily in areas where invasive vegetation has been removed.

Per KMZ 90.150.2, solely enhancing a wetland to mitigate for direct impacts to a Category II wetland must occur at a 12:1 (mitigation-to-impact) ratio. However, the City’s critical areas regulations do not provide specific guidance or impact to mitigation ratios for indirect impacts to wetlands due to the shading of vegetation. Therefore, the City Planning Department has recommended that ratios be determined using guidance based on best available science in *Wetland Mitigation in Washington State Part 1: Agency Policies and Guidelines* (Ecology et al., 2006). According to the guidance, standard mitigation ratios may be reduced when impacts to wetlands are either not permanent (long-term temporary) or if the impact may convert the wetland from one vegetation class to another. The recommended ratios for the two circumstances are one-quarter and one-half of the recommended ratio for direct impacts, respectively.

**Long-Term Temporary Impacts**

Long-term temporary impacts refer to ecological functions that can be replaced in less than two years (Ecology et al., 2006). Minor temporal loss of ecological function of emergent wetland communities is anticipated due to the permanent shading of the boardwalk. However, this functional loss is not anticipated to be permanent due to the amount of light that will penetrate the boardwalk as well as the height of the boardwalk. We anticipate that wetland functions will fully return to pre-construction levels within two growing seasons and therefore propose that emergent communities being shaded by the boardwalk are mitigated at a 3:1 ratio, or one-quarter of the 12:1 recommended ratio.

**Wetland Conversion Impacts**

Wetland conversion impacts refer to the loss of functions due to the conversion of a wetland from one type of vegetation class to another (Ecology et al., 2006). In areas where the boardwalk will cover scrub-shrub communities, the cutting of existing vegetation during construction of the boardwalk, as well as the subsequent shading from the boardwalk, may convert these communities into emergent communities, and therefore may retain a lower ecological function post-construction. To mitigate for the loss of functions
due to the possible conversion of wetland areas that are PSS-dominant, to PEM-dominant communities, we propose that all scrub-shrub communities being shaded by the boardwalk are mitigated at a 6:1 ratio, or one-half of the recommended 12:1 ratio.

The indirect impacts anticipated by the project were divided into these two types of impacts based on their vegetative class, and the appropriate reduced mitigation ratio applied as summarized in Table 6-3 and Figure 9. A total of 25,713 SF of wetland enhancement is proposed for the 5,592 SF of indirect impacts to Wetland A.

Wetland enhancement will occur in the western portion of Wetland A, primarily along the existing boardwalk. This area of wetland contains extensive patches of reed canarygrass and some Himalayan blackberry, mixed with native shrubs. This portion of the site (mitigation Opportunity Area “HI”) was also determined by the City to be a highly suitable site for mitigation opportunities (Watershed Company, 2018). To mitigate for the loss of functions due to boardwalk shading, 27,262 SF, or an additional 1,549 SF than required, will be enhanced through the following techniques:

- Selectively remove non-native, invasive species with a focus on selected areas of reed canarygrass;
- Enhancement of wetland through the planting of native shrubs and emergent species, primarily in areas where invasive vegetation has been removed, with a focus on species that will outcompete reed canarygrass; and
- Installation of habitat features (snags, logs, woody debris piles, bird and bat boxes, etc.) that will provide refuge for wildlife and increase species diversity.

Selected areas where reed canarygrass is dominant will be located in the field. Plants will be cut by hand, as close to the surface of the ground as possible. After plants are removed, approximately four inches of natural wood chip mulch will be placed over the surface. Mulch will be anchored by jute matting and subsequently planted with a mix of container plants and live stakes. Candidate plant species include wet-adapted, quick-growing species that will shade out or outcompete reed canarygrass. Wetland mitigation details can be found in Figure 11a.

Additionally, as mentioned above, temporary impacts to wetland vegetation may occur where existing vegetation needs to be trimmed for boardwalk construction. These temporary impacts are limited to six
feet on either side of the boardwalk, and total 6,603 SF (Table 6-2, Figure 7). It is expected that vegetation damaged during construction would regrow in the following growing season and changes in the plant community between pre- to post-construction are not anticipated. If vegetation does not re-sprout during the next growing season, the City will provide recommendations on how to remediate the areas.

### 7.2 Wetland Buffer Mitigation Requirements and Approach

A total of 44,075 SF of direct and indirect impacts to the buffer are anticipated (Table 6-2 and Figure 7). The project will result in a total of 46,772 SF of buffer mitigation, or 2,697 SF more than the 1:1 mitigation ratio required by KZC 90.150. The project will mitigate for buffer impacts, in-kind and onsite.

To mitigate for the majority of these impacts, 22,677 SF of native trees, shrubs, and woody groundcover will be installed at the proposed play area (Figure 10), in the area of temporary buffer impacts (Figure 7 and Table 6-2). The majority of this area is currently asphalt and landscaped trees. Post-construction, buffer mitigation will provide a functional lift by increasing the availability and quality of habitat in a largely urban environment.

An additional 24,094 SF of buffer mitigation will occur along the northwest side of the CKC Trail in an additional area that was determined to be suitable for mitigation opportunities by the City (Watershed Company, 2018). This area (Mitigation Opportunity Area “G”), is approximately 0.5 acre in size, and is currently dominated by a mix of reed canarygrass and Himalayan blackberry. Buffer mitigation detail can be found in Figure 11b.

To mitigate for the loss of functions due to direct and indirect impacts to wetland buffer, a minimum of 46,772 SF of the buffer will be enhanced through the following techniques:

- Removing invasive vegetation and refuse from the wetland buffer;
- Enhancement of wetland buffer through the planting of native trees and shrubs, primarily in areas where invasive vegetation has been removed; and
- Installation of habitat features (snags, logs, woody debris piles, bird and bat boxes, etc.) that will provide refuge for wildlife and increase species diversity.

Additionally, the remaining 2,404 SF of temporary buffer impacts due to the installation of the approach ramps at either end of the boardwalk will be restored using the same native plant palette as the mitigation being performed along the CKC trail. The proposed plant schedule can be found in Figure 11c.

To further ensure the project results in a lift in ecological function, all tree removal will follow requirements in KZC 90.135 – Trees in Critical Areas and Critical Area Buffer. Removed trees will be used as habitat features onsite to the extent possible. Trees removed from the buffer will be replaced with one to three native trees per KZC 90.135.1 and as determined by the City’s Planning Official. Currently 188 trees are being proposed to replace the 96 trees that are being removed, or a replacement ratio of 1.96:1 (replacement : removal ratio).
Mitigation will comply with requirements in KMZ 90.145 and will include the following:

- Per general mitigation timing requirements in KMZ 90.145.5.a(1), mitigation will be completed immediately following or concurrent with construction, and prior to use or final inspection of the project.
- Per KMZ 90.145.6.b(2), the seed source for all plants installed at the mitigation site will be as local as possible and will be nursery propagated.
- Per KMZ 90.145.6.b(3), installed plant materials may be supported only when necessary. When deemed necessary, stakes shall follow the International Society of Arboriculture standards and must be removed as soon as the plant can support itself.
- Per KZC 90.145.6.b(5), erosion control measures have been designed that comply with the City’s Public Works Pre-Approved Plans and will be included in the final bid documents.
- Per KZC 90.145.6.b(7), all planted areas will have a temporary, above ground sprinkler system, set to automatic timers, that will be removed in the final year of monitoring (See Section 7.5). The exception to this is the park area which will have a permanent sprinkler system.

Additionally, a mitigation monitoring and maintenance plan, per KZC 90.160, has been developed to ensure wetland and wetland buffer mitigation successfully replaces lost functions and area.

### 7.3 Mitigation Goals, Objectives, and Performance Standards

The overall goal of wetland and associated buffer mitigation is to replace the habitats and functions lost or altered as a result of the Project, and meet the City’s goal of no net loss of wetland function per KZC. Because the installation of the boardwalk is not anticipated to change the water quality and hydrologic functions of the wetland, mitigation goals focus on restoring lost or already limited habitat functions.

### 7.4 Mitigation Goals

Specific mitigation goals include the following:

- Enhance approximately 27,262 SF of Category II wetland (Wetland A) through the removal of invasive species, primarily reed canarygrass, and planting native trees and shrubs.
- Enhance approximately 46,772 SF of wetland buffer through the planting of native trees and shrubs. 22,678 SF of this enhancement will occur at the park site. The remaining 24,094 SF will occur along the CKC Trail.
- Ensure that the 6,603 SF of temporary wetland impacts have returned to healthy, native vegetation within one growing season of being trimmed for the boardwalk construction.
• Enhance approximately 2,404 SF of temporarily impacted buffer caused by the construction of the approach ramps at each end of the boardwalk. Enhancement will include the planting of native trees and shrubs.

7.4.1 Objectives and Performance Standards

Objective 1: Install native shrub and tree species in the wetland mitigation area to enhance habitat structure and species diversity.

Performance Standard 1a: Year 1 – A minimum of five native woody shrub species will be planted within the wetland mitigation areas.

Performance Standard 1b: Year 1 – 100 percent survival of installed native woody species within 1 year of mitigation installation in all areas.

Performance Standard 1c: Year 1 – At least 20 percent coverage of native plant species in the wetland mitigation area (installed and desirable).

Performance Standard 1d: Year 2 – 80 percent survival of installed native woody species within 1 year of mitigation installation areas.

Performance Standard 1e: Year 3 – At least 50 percent coverage of native plant species in the wetland mitigation area (installed and desirable). Cover will be estimated using sub-samples (e.g., plots, line-intercept transects) that cover a minimum of 20 percent of the planting areas.

Performance Standard 1f: Year 5 – At least 80 percent coverage of native plant species in the wetland mitigation area (installed and desirable).

Objective 2: Install native tree, shrub, and groundcover in the buffer mitigation areas to enhance habitat structure and species diversity.

Performance Standard 1a: Year 1 – 100 percent survival of installed native woody species within 1 year of mitigation installation in all areas.

Performance Standard 1b: Year 2 – 80 percent survival of installed native woody species.

Performance Standard 1c: Year 3 – At least 50 percent coverage by woody native plant species in all areas (installed and desirable volunteer). Survival will be estimated using sub-samples (e.g., plots, line-intercept transects) that cover a minimum of 20 percent of the planting areas.

Performance Standard 1d: Year 5 – At least 80 percent coverage by woody native plant species in all areas (installed and desirable volunteer).

Performance Standard 1e: Year 5 – Two out of three strata (trees, shrubs, woody groundcover) must compose at least 20 percent of aerial cover.
**Performance Standard 1f: Year 5** – At least three native species should each be making up a minimum of 10 percent coverage.

**Objective 3:** Remove non-native, invasive vegetation in wetland and wetland buffer mitigation areas.

**Performance Standard 3a: All Years** – Species on King County’s Noxious Weed List will not exceed 10 percent aerial cover in all planting areas of the wetland and wetland buffer mitigation sites throughout the 5-year monitoring period, with the exception of reed canarygrass which shall not exceed 20 percent cover where pre-existing monocultures occurred in the wetland enhancement area.

**Performance Standard 3b: All Years** – There should be no presence of knot weed in all planting areas of the wetland and wetland buffer mitigation sites throughout the 5-year monitoring period.

### 7.5 Monitoring Plan

Construction monitoring will ensure that clearing limits are maintained as described in the construction documents and plans, and that sediment control devices such as silt fences, are in working order. As mentioned above, erosion control measures have been designed that comply with the City’s Public Works Pre-Approved Plans and will be included in the final bid documents.

Mitigation monitoring will also be conducted. The main objective for mitigation monitoring is to document the level of success in meeting the Project’s performance standards. The proposed wetland and buffer enhancement mitigation will be monitored for 5 years per KZC 90.160. The following describes the monitoring approach for Years 1 through 5.

#### 7.5.1 Schedule

An initial stem count of the installed vegetation will be conducted following construction (an as-built count). Monitoring of mitigation areas will continue annually for 5-years post-construction. A qualified biologist or landscape designer will conduct the monitoring. The as-built plan will be used as the basis for monitoring of plant survival. Monitoring will begin the first full growing season after construction is complete and the plants have been installed.

#### 7.5.2 Data Collection

Shrub and tree cover will be evaluated quantitatively and qualitatively one year after construction, as well as in Years 2, 3, and 5. Two site visits (one in the spring and one in the fall) will occur during Years 1 and 2. If performance standards are met for the first two years then only one site visit will occur for the remaining 3 years of monitoring. The following information will be recorded during each of the monitoring site visits:

- Survival rates of installed vegetation during plant warranty period based on sub-sample of the mitigation area (e.g., plots, line-intercept transects).
• General plant health assessment and plant aerial coverage from established sampling points and transects (e.g., line-intercept).
• Presence of undesirable plants (weedy and/or non-native species) with estimated percent cover.
• Photo documentation of site conditions from established photo points.
• Impacts to the wetland buffer from human use (e.g., dumping of debris).
• Signs of wildlife use.

7.5.3 Reporting

Monitoring reports will be prepared by a qualified biologist or landscape designer for review and approval by regulatory agencies during monitoring Years 1, 2, 3, and 5. The reports will compare the performance standards described in the mitigation plan to the field observations during monitoring, and will recommend species replacements or other maintenance activities, if necessary (see Maintenance section below). Reports will present data collected during the site visits and document success in meeting specific performance standards. Photographs will illustrate and document site conditions. Monitoring reports will be submitted by the end of each monitoring year to the City’s Public Works Department.

7.6 Maintenance

Maintenance of the mitigation area will begin after completion of the Project and continue, as needed, for 5 years. After the initial planting acceptance by the project biologist, the landscaping contractor will be responsible for plant survival for a period of 1 year. The City will provide maintenance, as necessary. Maintenance could include, but may not be limited to, the following:

• Irrigate during dry periods.
• Remove non-native or invasive plant species.
• Add soil amendments and/or mulch.
• Install fencing around woody plants to prevent animal damage.
• Construct fencing to prevent vandalism or damage caused by humans.
• Install supplemental plantings as needed.

Based on monitoring results, the City will implement required maintenance and will determine how corrective measures will be addressed (e.g., which department[s] will provide funding) should they be necessary.

7.7 Contingency

If any portion of the mitigation is not successful, a contingency plan will be implemented. Such plans are prepared on a case-by-case basis to remedy any aspects of the mitigation that do not meet the performance standards. The plan, if required, would be developed in cooperation with the regulating
agencies. Additionally, vegetation trimmed in the wetland during boardwalk construction is expected to regrow during the following growing season. If vegetation does not re-sprout during the next growing season, the City will assess and replant as needed.

### 7.8 Site Protection

The wetland and buffer mitigation areas are under a protective covenant through the Parks and Public Works Department that precludes future use of these areas (except for the purposes of enhancing or restoring the mitigation associated with this Project).

A split rail fence will be constructed along the southern edges of the buffer enhancement area near the park’s play area to discourage access to the location. Critical area signs will be posted on the split rail fence at intervals of approximately 100 feet.

### 8.0 FINAL MITIGATION PLAN

Detailed design of the mitigation plan will not proceed until the City’s planning department has approved the initial mitigation concept. Once the mitigation concept is approved, a detailed mitigation design will be prepared along with a Final Wetland Mitigation Plan. The Final Wetland Mitigation Plan will:

- Finalize wetland and buffer impacts based on final design details for the boardwalk, trail, and park;
- Field verify and survey Mitigation Opportunity Areas G and HI, as needed;
- Identify mitigation requirements for all the affected wetlands and buffers and identify specific goals and objectives for the mitigation;
- Include detailed landscape design documents for the proposed mitigation construction.

The final mitigation plan will be completed and submitted to the City prior to the issuance of permits for the project.

### 9.0 LIMITATIONS

Within the limitations of schedule, budget, scope-of-work, and seasonal constraints, we warrant that this study was conducted in accordance with generally accepted environmental science practices, including the technical guidelines and criteria in effect at the time this study was performed, as outlined in the Methods section. The results and conclusions of this report represent the authors’ best professional judgment, based upon information provided by the project proponent in addition to that obtained during the course of this study. No other warranty, expressed or implied, is made.

1. CONTAINER PLANTING

- Remove container, gently loosen tight root mass and untangle roots.
- 3" depth wood chip mulch, keep away from stems.
- Backfill with native soil.
- Pedestal of existing soil.
- Tamper thoroughly with foot only.
- Undisturbed subgrade.

Set root crown at height of finish grade.

2. PLUG PLANTING

- Plant roots to be straight and undamaged by installation.
- Open planting hole large enough to accommodate roots.
- Cover roots with soil and lightly tap to eliminate air pockets in planting. Backfill with native soil.

3. TYPICAL PLANTING LAYOUT

- Container plant spacing, typ.
- 3"Ø mulch ring.

Notes:
1. Restoration planting layout is conceptual and intended to show groupings of similar species of plants.
2. Group each species in clusters of 3, 5, 7, or 9.
3. Plant layout and triangular spacing may be adjusted to meet field conditions with the acceptance of the project representative.
MITIGATION PLANTING NOTES

PARKING
1. CONTRACTOR SHALL KEEP ALL NEARBY WALKING PATHS CLEAR AT ALL TIMES AND SHALL NOT PARK OR STORE VEHICLES ALONG THE ‘ESPLANADE’ ADJACENT TO THE MITIGATION SITE. CONTRACTOR MAY CROSS THE ESPLANADE WITH CAUTION AND PARK ON THE DRIVEWAY WEST OF THE SITE. CLEAR OF THE ESPLANADE.

CLEARING AND TREE PROTECTION
2. USING HAND-HELD EQUIPMENT, REMOVE ALL INVASIVE SPECIES FROM THE MITIGATION AREA PRIOR TO INSTALLATION USING METHODS APPROVED BY THE STATE OF WASHINGTON NOXIOUS WEED CONTROL BOARD. SPECIFIC SPECIES TO BE REMOVED INCLUDE KNOTWEED (POLYGONUM SPP.), HIMALAYAN BLACKBERRY (Rubus armeniacus), AND REED CANARYGRASS (Phalaris arundinacea).
3. SELECTED AREAS WHERE REED CANARYGRASS IS DOMINANT WILL BE LOCATED IN THE FIELD. PLANTS WILL BE CUT BY HAND, AS CLOSE TO THE SURFACE OF THE GROUND AS POSSIBLE. AFTER PLANTS ARE REMOVED, APPROXIMATELY FOUR INCHES OF NATURAL WOOD CHIP MULCH WILL BE PLACED OVER THE SURFACE. MULCH WILL BE ANCHORED BY JUTE MATTING AND SUBSEQUENTLY PLANTED.
4. PRESERVE AND PROTECT ALL EXISTING WETLANDS, TREES AND VEGETATION NOT DESIGNATED FOR REMOVAL. PROVIDE, ERECT AND MAINTAIN TEMPORARY FENCING TO PREVENT ACCESS TO EXISTING WETLANDS OR WETLAND BUFFERS BY ANY VEHICLES.
5. DO NOT DRIVE OR PARK ANY VEHICLES OR EQUIPMENT, STORE MATERIALS, STOCKPILE SOIL OR GRAVEL, OR DISPOSE OF ANY CONSTRUCTION OR WASTE MATERIAL WITHIN EXISTING WETLANDS OR WETLAND BUFFER OR NEAR NEWLY INSTALLED PLANTS. RESTRICT FOOT TRAFFIC WITHIN PROTECTED AREAS.

PLANTING
6. SEED SOURCE MUST BE AS LOCAL AS POSSIBLE, AND PLANTS MUST BE NURSERY PROPAGATED UNLESS TRANSPLANTED FROM ON-SITE AREAS APPROVED FOR DISTURBANCE.
7. CUTTINGS ARE LIVE PLANT MATERIAL WITHOUT A PREVIOUSLY DEVELOPED ROOT SYSTEM. SOURCE PLANTS FOR CUTTINGS SHALL BE DORMANT WHEN CUTTINGS ARE TAKEN AND ALL CUTS SHALL BE MADE WITH A SHARP INSTRUMENT. CUTTINGS MAY BE COLLECTED. IF CUTTINGS ARE COLLECTED, THE REQUIREMENT TO BE NURSERY GROWN OR HELD IN NURSERY CONDITIONS DOES NOT APPLY. WRITTEN PERMISSION SHALL BE OBTAINED FROM PROPERTY OWNERS AND PROVIDED TO THE ENGINEER BEFORE CUTTINGS ARE COLLECTED. THE CONTRACTOR SHALL COLLECT CUTTINGS IN ACCORDANCE WITH APPLICABLE SENSITIVE AREA ORDINANCES.
8. LIVE STAKE CUTTINGS SHALL HAVE A STRAIGHT TOP CUT IMMEDIATELY ABOVE A BUD. THE LOWER, ROOTING END SHALL BE CUT AT AN APPROXIMATE 45-DEGREE ANGLE. LIVE STAKES ARE CUT FROM ONE TO TWO YEAR OLD WOOD. LIVE STAKE CUTTINGS SHALL BE CUT AND INSTALLED WITH THE BARK INTACT WITH NO BRANCHES OR STEMS ATTACHED, AND BE 1 INCH IN DIAMETER.
9. PLANTING AREAS SHOULD BE STAKED IN THE FIELD FOR ACCEPTANCE BY THE ENGINEER PRIOR TO INSTALLATION.
10. PRIOR TO PLANTING, PLACE ALL PLANTS AS INDICATED ON THE PLANS, OR MARK EACH LOCATION WITH WOOD STAKES OR COLOR WIRE FLAGS MARKED WITH THE FIRST TWO LETTERS OF BOTH PLANT GENUS AND SPECIES (E.G. PH CA FOR PHYSOCARPUS CAPITATUS). NO PLANTING HOLES SHALL BE DUG OR BACKFILLED WITHOUT PRIOR APPROVAL OF ENGINEER. NOTIFY ENGINEER A MINIMUM OF 72 HOURS BEFORE PLANTING TO ALLOW AMPLE TIME TO ADJUST PLANT LOCATIONS. PROVIDE EXTRA STAKES OR FLAGS SUFFICIENT TO MARK LOCATIONS OF PLANTS NOT LOCATED ON PLAN.
11. PLANT MATERIALS MAY BE SUPPORTED WITH MATERIAL (E.G. STAKES, GUY WIRES) ONLY WHEN NECESSARY. STAKING AND TIES SHALL FOLLOW THE INTERNATIONAL SOCIETY OF ARBORICULTURE STANDARDS. WHERE SUPPORT IS NECESSARY, STAKES, GUY WIRES, OR OTHER MEASURES MUST BE REMOVED AS SOON AS THE PLANT CAN SUPPORT ITSELF, USUALLY AFTER THE FIRST GROWING SEASON.
12. ALL PLANTED AREAS OF THE MITIGATION PROJECT SHALL HAVE A TEMPORARY, ABOVE GROUND SPRINKLER SYSTEM SET TO AUTOMATIC TIMERS. TEMPORARY SPRINKLER SYSTEMS SHALL BE REMOVED IN THE FINAL YEAR OF MONITORING ONCE VEGETATION IS WELL ESTABLISHED. WHEN PUBLIC OR PRIVATE WATER IS NOT AVAILABLE, A PLAN FOR RELIABLE WATERING BY TRUCK OR HAND SHALL BE INCLUDED.

FENCING AND SIGNAGE
13. INSTALL PERMANENT SPLIT RAIL FENCING ALONG THE EDGES OF CRITICAL AREAS AS SHOWN ON PLANS AND ATTACH PERMANENT SIGNS TO THE FENCE. BOTH FENCING AND SIGNAGE ARE TO BE AS SPECIFIED IN KZC 90.190.

MONITORING - PERFORMANCE STANDARDS
14. PERCENT SURVIVAL OF INSTALLED SHRUBS AND TREES:
   • 100 PERCENT SURVIVAL MEASURED BEFORE THE END OF YEAR 1 (TO DETERMINE 1 YEAR PLANT GUARANTEE)
   • AT LEAST 80 PERCENT SURVIVAL AT THE END OF YEAR 2
   • PERCENT COVER OF NATIVE TREES AND SHRUBS (INSTALLED AND VOLUNTEER) WITHIN WETLAND AND BUFFER ENHANCEMENT AREAS:
   • 20 PERCENT COVER IN YEAR 1
   • 50 PERCENT COVER IN YEAR 3
   • 80 PERCENT COVER IN YEAR 5
15. PERCENT COVER OF NON-NATIVES WITHIN WETLAND AND BUFFER ENHANCEMENT AREAS:
   SPECIES ON KING COUNTY’S NOXIOUS WEED LIST WILL NOT EXCEED 10 PERCENT AERIAL COVER IN ALL PLANTING AREAS OF THE WETLAND AND WETLAND BUFFER MITIGATION SITES THROUGHOUT THE 5-YEAR MONITORING PERIOD. WITH THE EXCEPTION OF REED CANARYGRASS WHICH SHALL NOT EXCEED 20 PERCENT COVER WHERE PRE-EXISTING MONOCULTURES OCCURRED IN THE WETLAND ENHANCEMENT AREA.
   THERE SHOULD BE NO PRESENCE OF KNOT WEED IN ALL PLANTING AREAS OF THE WETLAND AND WETLAND BUFFER MITIGATION SITES THROUGHOUT THE 5-YEAR MONITORING PERIOD.

(NOTES CONTINUED ON NEXT SHEET)
MITIGATION PLANTING NOTES - CONTINUED FROM PREVIOUS SHEET

MONITORING - SCHEDULE

16. An initial stem count of planted material will occur following installation of mitigation plantings, which will be used to determine percent survival in Years 1 and 2. An as-built report will be prepared to describe the site conditions post-enhancement, including number and kind of installed native trees and shrubs and approximate percent cover of non-native species. Preliminary data outlined in this report will be referenced for comparison in subsequent monitoring reports.

17. Monitoring of mitigation areas will occur once 30 days after planting (stem count and as-built preparation), once early in the growing season of the first full growing season following planting (Year 1), once at the end of the first full growing season (Year 1), and annually for four years thereafter (Years 2-5). Permanent sampling points and photo points will be established by the monitoring biologist during the initial site visit. A qualified biologist or landscape designer working for or contracted by the applicant will conduct all subsequent monitoring and reporting.

MONITORING - DATA COLLECTION

18. Total installed plant counts and percent survival will be conducted during Year 1 and 2. Percent cover for installed shrub and trees will be evaluated in Years 1 through 5 using appropriate monitoring methodology established during Year 0. The following information will be recorded during monitoring site visits:
   - Overall aerial coverage of trees, shrubs, and herbaceous species in monitoring plots/transects
   - Documentation of any non-native species and recommendations for control
   - Qualitative site health
   - Photo documentation of site conditions
   - Impacts to the wetland/buffer from human use; and
   - Signs of wildlife use of the area.

MONITORING - REPORTING

19. Monitoring reports will be prepared and submitted to the City of Kirkland after each monitoring year by a qualified biologist, and will contain the information mentioned above, as well as photos taken from established photo points, documentation of areas which do not meet performance standards, and recommended corrective actions.

MAINTENANCE

20. Maintenance of the mitigation area will begin after completion of the project and will continue as needed for up to five years. After the initial planting acceptance by the engineer, the landscaping contractor will be responsible for plant survival for a period of one year. After that, the city of Kirkland maintenance crew will perform maintenance. During Year 1, every failed plant must be replaced within the first year following installation and acceptance. Maintenance activities could include, but may not be limited to:
   - Installing supplemental plantings, as needed
   - Use of herbicide according to best management practices to control invasive species
   - Watering or providing irrigation during unseasonably dry periods or when the soils are unusually dry
   - Invasive species control in the mitigation area and maintaining mulch at a 1 inch depth
   - Providing fencing around ground plants or shrubs to prevent animal damage; and
   - Providing fencing to prevent vandalism or damage caused by humans.

CONTINGENCY

21. If any portion of the mitigation is not successful, a contingency plan will be implemented. Such plans are developed on a case-by-case basis to remedy aspects of mitigation that do not meet stated site goals. The contingency plan would be developed in cooperation with the city of Kirkland.

22. Apply buffer hydroseed mix only in areas where mitigation planting has not been located but has been impacted during planting work.

Southern wetland buffer dominated by Himalayan blackberry; looking southeast.
Appendix A: Methods Used to Evaluate Wetland Characteristics
Wetland Definition

Wetlands are formally defined by the U.S. Army Corps of Engineers (Corps) (Federal Register 1982), the Environmental Protection Agency (EPA) (Federal Register 1988), the Washington Shoreline Management Act (SMA) of 1971 (Ecology, 1991) and the Washington State Growth Management Act (GMA) (Ecology, 1992) as

... those areas that are inundated or saturated by surface or groundwater at a frequency and duration sufficient to support, and that under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions. Wetlands generally include swamps, marshes, bogs, and similar areas (Federal Register, 1982, 1986).

In addition, the SMA and the GMA definitions add:

Wetlands do not include those artificial wetlands intentionally created from non-wetland site, including, but not limited to, irrigation and drainage ditches, grass-lined swales, canals, detention facilities, wastewater treatment facilities, farm ponds, and landscape amenities, or those wetlands created after July 1, 1990 that were unintentionally created as a result of the construction of a road, street, or highway. Wetlands may include those artificially created wetlands intentionally created from non-wetland areas to mitigate the conversion of wetlands.

ESA used the methods defined in Regional Supplement to the U.S. Army Corps of Engineers 1987 Wetlands Delineation Manual (Corps, 2008) to determine the presence and extent of wetlands in the study area. The methodology is based upon three essential characteristics of wetlands: (1) hydrophytic vegetation; (2) hydric soils; and (3) wetland hydrology. Field indicators of these three characteristics must all be present in order to determine that an area is a wetland (unless problem areas or atypical situations are encountered).

The methodology outlined in the manuals is based upon three essential characteristics of wetlands: (1) hydrophytic vegetation; (2) hydric soils; and (3) wetland hydrology. Field indicators of these three characteristics must all be present in order to determine that an area is a wetland (unless problem areas or atypical situations are encountered). These characteristics are discussed below.

Vegetation

Plants must be specially adapted for life under saturated or anaerobic conditions to grow in wetlands. The U.S. Fish and Wildlife Service (USFWS) has determined the estimated probability of each plant species’ occurrence in wetlands and has accordingly assigned a “wetland indicator status” (WIS) to each species (USFWS, 1988, 1993). Plants are categorized as obligate (OBL), facultative wetland (FACW), facultative (FAC), facultative upland (FACU), upland (UPL), not listed (NL), or no indicator status (NI). Definitions for each indicator status are listed below.
Species with an indicator status of OBL, FACW, or FAC are considered adapted for life in saturated or anaerobic soil conditions. Such species are referred to as “hydrophytic” vegetation.

Key to Wetland Indicator Status codes – Northwest Region (Source: USFWS, 1988, 1993):

- **OBL** Obligate: species that almost always occur wetlands under natural conditions (est. probability >99%).
- **FACW** Facultative wetland: species that usually occur in wetlands (est. probability 67 to 99%), but are occasionally found in non-wetlands.
- **FAC** Facultative: species that are equally likely to occur in wetlands or non-wetlands (est. probability 34 to 66%).
- **FACU** Facultative upland: species that usually occur in non-wetlands (est. probability 67 to 99%), but are occasionally found in wetlands.
- **UPL** Upland: species that almost always occur in non-wetlands under normal conditions (est. probability >99%).
- **NL** Not listed: species that are not listed by USFWS (1988, 1993) and are presumed to be upland species.
- **NI** No indicator: species for which insufficient information is available to determine status, or which were not evaluated by USFWS.

Areas of relatively homogeneous vegetative composition can be characterized by “dominant” species. The indicator status of the dominant species within each vegetative stratum is used to determine if the plant community may be characterized as hydrophytic. The vegetation of an area is considered to be hydrophytic if more than 50% of the dominant species have an indicator status of OBL, FACW, or FAC. The Regional Supplements provide additional tests for evaluating the presence of hydrophytic vegetation communities including the prevalence index, morphological adaptations, and wetland non-vascular plants. The Supplements also address difficult situations where hydrophytic vegetation indicators are not present but hydric soils and wetland hydrology are observed.

**Soils**

Hydric soils are indicative of wetlands. Hydric soils are defined as soils that are saturated, flooded, or ponded long enough during the growing season to develop anaerobic conditions in the upper part of the soil profile (Federal Register, 1994). The Natural Resources Conservation Service (NRCS), in cooperation with the National Technical Committee for Hydric Soils, has compiled lists of hydric soils (NRCS, 1995). These lists identify soil series mapped by the NRCS that meet hydric soil criteria. It is common, however, for a map unit of non-wetland (non-hydric) soil to have inclusions of hydric soil, and vice versa. Therefore, field examination of soil conditions is important to determine if hydric soil conditions exist.

The NRCS has developed a guide for identifying field indicators of hydric soils (NRCS, 2010). This list of hydric soil indicators is considered to be dynamic; revisions are anticipated to occur on a regular basis as a result of ongoing studies of hydric soils. In general, anaerobic conditions create certain characteristics in hydric soils, collectively known as “redoximorphic features.”
that can be observed in the field (Vepraskas, 1999). Redoximorphic features include high organic content, accumulation of sulfidic material (rotten egg odor), greenish- or bluish-gray color (gley formation), spots or blotches of different color interspersed with the dominant or matrix color (mottling), and dark soil colors (low soil chroma) (NRCS, 2010; Vepraskas, 1999).

Soil colors are described both by common color name (for example, “dark brown”) and by a numerical description of their hue, value, and chroma (for example, 10YR 2/2) as identified on a Munsell soil color chart (Munsell Color, 2000). Soil color is determined from a moist soil sample.

The Regional Supplements provide methods for difficult situations where hydric soil indicators are not observed, but indicators of hydrophytic vegetation and wetland hydrology are present.

Hydrology

Water must be present in order for wetlands to exist; however, it need not be present throughout the entire year. Wetland hydrology is considered to be present when there is permanent or periodic inundation or soil saturation at or near the soil surface for more than 12.5% of the growing season (typically two weeks in lowland Pacific Northwest areas). Areas that are inundated or saturated for between 5% and 12.5% of the growing season in most years may or may not be wetlands. Areas inundated or saturated for less than 5% of the growing season are non-wetlands (Ecology, 1997).

Indicators of wetland hydrology include observation of ponding or soil saturation, water marks, drift lines, drainage patterns, sediment deposits, oxidized rhizospheres, water-stained leaves, and local soil survey data. Where positive indicators of wetland hydrology are observed, it is assumed that wetland hydrology occurs for a sufficient period of the growing season to meet the wetland criteria, as described by Ecology (1997). The Regional Supplements provide methods for evaluating situations in wetlands that periodically lack indicators of wetland hydrology but where hydric soils and hydrophytic vegetation are present.

Totem Lake Park Development – Phase 1
Critical Areas Report and Conceptual Mitigation Plan

Preliminary – Subject to Revision
Appendix C: Washington State Wetland Rating System and Rating Forms
Washington State Wetland Rating System

The observed wetlands were rated using the Washington State Department of Ecology’s *Wetland Rating System for Western Washington* (Hruby, 2004). This system was developed by Ecology to differentiate wetlands based on their sensitivity to disturbance, their significance, their rarity, our ability to replace them, and the beneficial functions they provide to society. Wetlands are categorized using the Ecology rating system according to the following criteria:

**Category I wetlands** represent a unique or rare wetland type; or are more sensitive to disturbance; or are relatively undisturbed and contain ecological attributes that are impossible to replace within a human lifetime.

**Category II wetlands** are difficult, though not impossible, to replace, and provide high levels of some functions.

**Category III wetlands** have a moderate level of function. They have been disturbed in some ways, and are often less diverse or more isolated from other natural resources in the landscape than Category II wetlands.

**Category IV wetlands** have the lowest levels of functions and are often heavily disturbed.

In 2014, Ecology updated the rating system (Hruby, 2014). However, wetland ratings performed prior to January 1, 2015 using the 2004 rating system are still considered valid (Ecology, 2015).
Appendix E: Arborist Reports and Tree Plans
Wetland name or number: A

RATING SUMMARY – Western Washington

Name of wetland (or ID #): Wetland A – Totem Lake Date of site visit: 1/5/2016

Rated by: J. Redman Trained by Ecology? ☐ Yes ☐ No Date of training: Mar-15

HGM Class used for rating: Depressional & Flats Wetland has multiple HGM classes? ☐ Yes ☐ No

HGM Classification of Wetland in Western Washington

For questions 1-7, the criteria described must apply to the entire unit being rated. If hydrologic criteria listed in each question do not apply to the entire unit being rated, you probably have a unit with multiple HGM classes. In this case, identify which hydrologic criteria in questions 1-7 apply, and go to Question 8.

1. Are the water levels in the entire unit usually controlled by tides except during floods?
   - ☑ NO - go to 2
   - ☐ YES - the wetland class is Tidal Fringe - go to 1.1

   1.1 Is the salinity of the water during periods of annual low flow below 0.5 ppt (parts per thousand)?
   - ☑ NO - Saltwater Tidal Fringe (Estuarine)
   - ☐ YES - Freshwater Tidal Fringe

      * If your wetland can be classified as a Freshwater Tidal Fringe use the forms for Riverine wetlands.
      * If it is Saltwater Tidal Fringe it is an Estuarine wetland and is not scored. This method cannot be used to score functions for estuarine wetlands.

2. The entire wetland unit is flat and precipitation is the only source (>90%) of water to it. Groundwater and surface water runoff are NOT sources of water to the unit.
   - ☑ NO - go to 3
   - ☐ YES - The wetland class is Flats

      * If your wetland can be classified as a Flats wetland, use the form for Depressional wetlands.

3. Does the entire wetland unit meet all of the following criteria?
   - ☑ NO - go to 4
   - ☐ YES - The wetland class is Lake Fringe (Lacustrine Fringe)

   * The vegetated part of the wetland is on the shores of a body of permanent open water (without any plants on the surface at any time of the year) at least 20 ac (8 ha) in size;
   * At least 30% of the open water area is deeper than 6.6 ft (2 m).

4. Does the entire wetland unit meet all of the following criteria?
   - ☑ NO - go to 5
   - ☐ YES - The wetland class is Slope

      * The water leaves the wetland without being impounded.

      * The overbank flooding occurs at least once every 2 years.

      * The unit is in a valley, or stream channel, where it gets inundated by overbank flooding from that stream or river.

      * The overbank flooding occurs at least once every 2 years.

   - ☑ NO - go to 6
   - ☐ YES - The wetland class is Riverine

   * The Riverine unit can contain depressions that are filled with water when the river is not flooding.

   NOTE: The Riverine unit can contain depressions that are filled with water when the river is not flooding.
6. Is the entire wetland unit in a topographic depression in which water ponds, or is saturated to the surface, at some time during the year? *This means that any outlet, if present, is higher than the interior of the wetland.*

☐ NO - go to 7

☑ YES - The wetland class is Depressional

7. Is the entire wetland unit located in a very flat area with no obvious depression and no overbank flooding? The unit does not pond surface water more than a few inches. The unit seems to be maintained by high groundwater in the area. The wetland may be ditched, but has no obvious natural outlet.

☐ NO - go to 8

☑ YES - The wetland class is Depressional

8. Your wetland unit seems to be difficult to classify and probably contains several different HGM classes. For example, seeps at the base of a slope may grade into a riverine floodplain, or a small stream within a Depressional wetland has a zone of flooding along its sides. **GO BACK AND IDENTIFY WHICH OF THE HYDROLOGIC REGIMES DESCRIBED IN QUESTIONS 1-7 APPLY TO DIFFERENT AREAS IN THE UNIT (make a rough sketch to help you decide). Use the following table to identify the appropriate class to use for the rating system if you have several HGM classes present within the wetland unit being scored.**

**NOTE:** Use this table only if the class that is recommended in the second column represents 10% or more of the total area of the wetland unit being rated. If the area of the HGM class listed in column 2 is less than 10% of the unit; classify the wetland using the class that represents more than 90% of the total area.

<table>

Habitat Functions - Indicators that site functions to provide important habitat

### H 1.0. Does the site have the potential to provide habitat?

**H 1.1. Structure of plant community:** *Indicators are Cowardin classes and strata within the Forested class.* Check the Cowardin plant classes in the wetland. **Up to 10 patches may be combined for each class to meet the threshold of ¼ ac or more than 10% of the unit if it is smaller than 2.5 ac. Add the number of structures checked.**

- [ ] Aquatic bed 4 structures or more: points = 4
- [ ] Emergent 3 structures: points = 2
- [ ] Scrub-shrub (areas where shrubs have > 30% cover) 2 structures: points = 1
- [ ] Forested (areas where trees have > 30% cover) 1 structure: points = 0

*If the unit has a Forested class, check if:*
- [x] The Forested class has 3 out of 5 strata (canopy, sub-canopy, shrubs, herbaceous, moss/ground-cover) that each cover 20% within the Forested polygon

### H 1.2. Hydroperiods

Check the types of water regimes (hydroperiods) present within the wetland. The water regime has to cover more than 10% of the wetland or ¼ ac to count (*see text for descriptions of hydroperiods*).

- [ ] Permanently flooded or inundated 4 or more types present: points = 3
- [ ] Seasonally flooded or inundated 3 types present: points = 2
- [ ] Occasionally flooded or inundated 2 types present: points = 1
- [ ] Saturated only 1 types present: points = 0
- [ ] Permanently flowing stream or river in, or adjacent to, the wetland
- [ ] Seasonally flowing stream in, or adjacent to, the wetland
- [ ] Lake Fringe wetland 2 points
- [ ] Freshwater tidal wetland 2 points

### H 1.3. Richness of plant species

Count the number of plant species in the wetland that cover at least 10 ft². *Different patches of the same species can be combined to meet the size threshold and you do not have to name the species.* **Do not include Eurasian milfoil, reed canarygrass, purple loosestrife, Canadian thistle**

- If you counted:  
  - > 19 species points = 2  
  - 5 - 19 species points = 1  
  - < 5 species points = 0

### H 1.4. Interspersion of habitats

Decide from the diagrams below whether interspersion among Cowardin plants classes (described in H 1.1), or the classes and unvegetated areas (can include open water or mudflats) is high, moderate, low, or none. **If you have four or more plant classes or three classes and open water, the rating is always high.**

- None = 0 points
- Low = 1 point
- Moderate = 2 points
- All three diagrams in this row are HIGH = 3 points
H 1.5. Special habitat features:
Check the habitat features that are present in the wetland. The number of checks is the number of points.

- [ ] Large, downed, woody debris within the wetland (> 4 in diameter and 6 ft long)
- [ ] Standing snags (dbh > 4 in) within the wetland
- [ ] Undercut banks are present for at least 6.6 ft (2 m) and/or overhanging plants extends at least 3.3 ft (1 m) over a stream (or ditch) in, or contiguous with the wetland, for at least 33 ft (10 m)
- [ ] Stable steep banks of fine material that might be used by beaver or muskrat for denning (> 30 degree slope) OR signs of recent beaver activity are present (cut shrubs or trees that have not yet weathered where wood is exposed)
- [ ] At least ¼ ac of thin-stemmed persistent plants or woody branches are present in areas that are permanently or seasonally inundated (structures for egg-laying by amphibians)
- [ ] Invasive plants cover less than 25% of the wetland area in every stratum of plants (see H 1.1 for list of strata)

Total for H 1  
Add the points in the boxes above 15

Rating of Site Potential

</table>

H 2.0. Does the landscape have the potential to support the habitat function of the site?

H 2.1 Accessible habitat (include only habitat that directly abuts wetland unit).

Calculate:

8 % undisturbed habitat + (________ 0 % moderate & low intensity land uses / 2 ) = 8%

If total accessible habitat is:

- > 1/3 (33.3%) of 1 km Polygon: points = 3
- 20 - 33% of 1 km Polygon: points = 2
- 10 - 19% of 1 km Polygon: points = 1
- < 10 % of 1 km Polygon: points = 0

H 2.2. Undisturbed habitat in 1 km Polygon around the wetland.

Calculate:

13 % undisturbed habitat + (________ 0 % moderate & low intensity land uses / 2 ) = 13%

- Undisturbed habitat > 50% of Polygon: points = 3
- Undisturbed habitat 10 - 50% and in 1-3 patches: points = 2
- Undisturbed habitat 10 - 50% and > 3 patches: points = 1
- Undisturbed habitat < 10% of 1 km Polygon: points = 0

H 2.3 Land use intensity in 1 km Polygon: If

- > 50% of 1 km Polygon is high intensity land use: points = (-2)
- ≤ 50% of 1 km Polygon is high intensity: points = 0

Total for H 2  
Add the points in the boxes above -1

H 3.0. Is the habitat provided by the site valuable to society?

H 3.1. Does the site provide habitat for species valued in laws, regulations, or policies? Choose only the highest score that applies to the wetland being rated.

Site meets ANY of the following criteria:

- [ ] It has 3 or more priority habitats within 100 m (see next page)
- [ ] It provides habitat for Threatened or Endangered species (any plant or animal on the state or federal lists)
- [ ] It is mapped as a location for an individual WDFW priority species
- [ ] It is a Wetland of High Conservation Value as determined by the Department of Natural Resources
- [ ] It has been categorized as an important habitat site in a local or regional comprehensive plan, in a Shoreline Master Plan, or in a watershed plan
- [ ] Site has 1 or 2 priority habitats (listed on next page) with in 100m
- [ ] Site does not meet any of the criteria above

</table>
WDFW Priority Habitats

Count how many of the following priority habitats are within 330 ft (100 m) of the wetland unit: **NOTE**: This question is independent of the land use between the wetland unit and the priority habitat.

- **Aspen Stands**: Pure or mixed stands of aspen greater than 1 ac (0.4 ha).

- **Biodiversity Areas and Corridors**: Areas of habitat that are relatively important to various species of native fish and wildlife (full descriptions in WDFW PHS report).

- **Herbaceous Balds**: Variable size patches of grass and forbs on shallow soils over bedrock.

- **Old-growth/Mature forests**: Old-growth west of Cascade crest – Stands of at least 2 tree species, forming a multi-layered canopy with occasional small openings; with at least 8 trees/ac (20 trees/ha) > 32 in (81 cm) dbh or > 200 years of age. Mature forests – Stands with average diameters exceeding 21 in (53 cm) dbh; crown cover may be less than 100%; decay, decadence, numbers of snags, and quantity of large downed material is generally less than that found in old-growth; 80-200 years old west of the Cascade crest.

- **Oregon White Oak**: Woodland stands of pure oak or oak/conifer associations where canopy coverage of the oak component is important (full descriptions in WDFW PHS report p. 158 – see web link above).

- **Riparian**: The area adjacent to aquatic systems with flowing water that contains elements of both aquatic and terrestrial ecosystems which mutually influence each other.

- **Westside Prairies**: Herbaceous, non-forested plant communities that can either take the form of a dry prairie or a wet prairie (full descriptions in WDFW PHS report p. 161 – see web link above).

- **Instream**: The combination of physical, biological, and chemical processes and conditions that interact to provide functional life history requirements for instream fish and wildlife resources.

- **Nearshore**: Relatively undisturbed nearshore habitats. These include Coastal Nearshore, Open Coast Nearshore, and Puget Sound Nearshore. (full descriptions of habitats and the definition of relatively undisturbed are in WDFW report – see web link on previous page).

- **Caves**: A naturally occurring cavity, recess, void, or system of interconnected passages under the earth in soils, rock, ice, or other geological formations and is large enough to contain a human.

- **Cliffs**: Greater than 25 ft (7.6 m) high and occurring below 5000 ft elevation.

- **Talus**: Homogenous areas of rock rubble ranging in average size 0.5 - 6.5 ft (0.15 - 2.0 m), composed of basalt, andesite, and/or sedimentary rock, including riprap slides and mine tailings. May be associated with cliffs.

- **Snags and Logs**: Trees are considered snags if they are dead or dying and exhibit sufficient decay characteristics to enable cavity excavation/use by wildlife. Priority snags have a diameter at breast height of > 20 in (51 cm) in western Washington and are > 6.5 ft (2 m) in height. Priority logs are > 12 in (30 cm) in diameter at the largest end, and > 20 ft (6 m) long.

**Note**: All vegetated wetlands are by definition a priority habitat but are not included in this list because they are addressed elsewhere.
**Wetland Type**  
*Check off any criteria that apply to the wetland. List the category when the appropriate criteria are met.*

<table>
<thead>
<tr>
<th>SC 1.0. Estuarine Wetlands</th>
<th>Category</th>
</tr>
</thead>
<tbody>
<tr>
<td>☐ Does the wetland meet the following criteria for Estuarine wetlands?</td>
<td></td>

<td></td>
</tr>
<tr>
<td>☐ With a salinity greater than 0.5 ppt</td>
<td></td>
</tr>
<tr>
<td>☑ Yes - Go to SC 1.1 ☐ No = Not an estuarine wetland</td>
<td></td>
</tr>
</tbody>
</table>

**SC 1.1.** Is the wetland within a National Wildlife Refuge, National Park, National Estuary Reserve, Natural Area Preserve, State Park or Educational, Environmental, or Scientific Reserve designated under WAC 332-30-151?  
☑ Yes = **Category I** ☐ No - Go to SC 1.2

**SC 1.2.** Is the wetland unit at least 1 ac in size and meets at least two of the following three conditions?  
☐ The wetland is relatively undisturbed (has no diking, ditching, filling, cultivation, grazing, and has less than 10% cover of non-native plant species. (If non-native species are *Spartina*, see page 25)  
☐ At least ¾ of the landward edge of the wetland has a 100 ft buffer of shrub, forest, or un-grazed or un-mowed grassland.  
☐ The wetland has at least two of the following features: tidal channels, depressions with open water, or contiguous freshwater wetlands.  
☑ Yes = **Category I** ☐ No = **Category II**

**SC 2.0. Wetlands of High Conservation Value (WHCV)**

**SC 2.1.** Has the WA Department of Natural Resources updated their website to include the list of Wetlands of High Conservation Value?  
☐ Yes - Go to SC 2.2 ☐ No - Go to SC 2.3

**SC 2.2.** Is the wetland listed on the WDNR database as a Wetland of High Conservation Value?  
☑ Yes = **Category I** ☐ No = Not WHCV

**SC 2.3.** Is the wetland in a Section/Township/Range that contains a Natural Heritage wetland?  
☐ Yes - Contact WNHP/WDNR and to SC 2.4 ☐ No = Not WHCV

**SC 2.4.** Has WDNR identified the wetland within the S/T/R as a Wetland of High Conservation Value and listed it on their website?  
☑ Yes = **Category I** ☐ No = Not WHCV

**SC 3.0. Bogs**

Does the wetland (or any part of the unit) meet both the criteria for soils and vegetation in bogs? *Use the key below. If you answer YES you will still need to rate the wetland based on its functions.*

**SC 3.1.** Does an area within the wetland unit have organic soil horizons, either peats or mucks, that compose 16 in or more of the first 32 in of the soil profile?  
☐ Yes - Go to SC 3.3 ☐ No - Go to SC 3.2

**SC 3.2.** Does an area within the wetland unit have organic soils, either peats or mucks, that are less than 16 in deep over bedrock, or an impermeable hardpan such as clay or volcanic ash, or that are floating on top of a lake or pond?  
☐ Yes - Go to SC 3.3 ☐ No = Is not a bog

**SC 3.3.** Does an area with peats or mucks have more than 70% cover of mosses at ground level, AND at least a 30% cover of plant species listed in Table 4?  
☐ Yes = **Is a Category I bog** ☐ No - Go to SC 3.4

**NOTE:** If you are uncertain about the extent of mosses in the understory, you may substitute that criterion by measuring the pH of the water that seeps into a hole dug at least 16 in deep. If the pH is less than 5.0 and the plant species in Table 4 are present, the wetland is a bog.

**SC 3.4.** Is an area with peats or mucks forested (> 30% cover) with Sitka spruce, subalpine fir, western red cedar, western hemlock, lodgepole pine, quaking aspen, Engelmann spruce, or western white pine, AND any of the species (or combination of species) listed in Table 4 provide more than 30% of the cover under the canopy?  
☐ Yes = **Is a Category I bog** ☐ No = Is not a bog
### SC 4.0. Forested Wetlands

Does the wetland have at least 1 contiguous acre of forest that meets one of these criteria for the WA Department of Fish and Wildlife’s forests as priority habitats? If you answer YES you will still need to rate the wetland based on its functions.

- **Old-growth forests** (west of Cascade crest): Stands of at least two tree species, forming a multi-layered canopy with occasional small openings; with at least 8 trees/ac (20 trees/ha) that are at least 200 years of age OR have a diameter at breast height (dbh) of 32 in (81 cm) or more.
- **Mature forests** (west of the Cascade Crest): Stands where the largest trees are 80-200 years old OR the species that make up the canopy have an average diameter (dbh) exceeding 21 in (53 cm).

[ ] Yes = Category I  [ ] No = Not a forested wetland for this section

### SC 5.0. Wetlands in Coastal Lagoons

Does the wetland meet all of the following criteria of a wetland in a coastal lagoon?

- The wetland lies in a depression adjacent to marine waters that is wholly or partially separated from marine waters by sandbanks, gravel banks, shingle, or, less frequently, rocks.
- The lagoon in which the wetland is located contains ponded water that is saline or brackish (> 0.5 ppt) during most of the year in at least a portion of the lagoon (needs to be measured near the bottom).

[ ] Yes - Go to SC 5.1  [ ] No = Not a wetland in a coastal lagoon

### SC 5.1. Does the wetland meet all of the following three conditions?

- The wetland is relatively undisturbed (has no diking, ditching, filling, cultivation, grazing), and has less than 20% cover of aggressive, opportunistic plant species (see list of species on p. 100).
- At least ¾ of the landward edge of the wetland has a 100 ft buffer of shrub, forest, or ungrazed or un-mowed grassland.
- The wetland is larger than \( \frac{1}{10} \) ac (4350 ft²)

[ ] Yes = Category I  [ ] No - Go to SC 6.2

### SC 6.0. Interdunal Wetlands

Is the wetland west of the 1889 line (also called the Western Boundary of Upland Ownership or WBUO)? If you answer yes you will still need to rate the wetland based on its habitat functions.

In practical terms that means the following geographic areas:

- Long Beach Peninsula: Lands west of SR 103
- Grayland-Westport: Lands west of SR 105
- Ocean Shores-Copalis: Lands west of SR 115 and SR 109

[ ] Yes - Go to SC 6.1  [ ] No = Not an interdunal wetland for rating

### SC 6.1. Is the wetland 1 ac or larger and scores an 8 or 9 for the habitat functions on the form (rates H,H,H or H,H,M for the three aspects of function)?

[ ] Yes = Category I  [ ] No - Go to SC 6.2

### SC 6.2. Is the wetland 1 ac or larger, or is it in a mosaic of wetlands that is 1 ac or larger?

[ ] Yes = Category II  [ ] No - Go to SC 6.3

### SC 6.3. Is the unit between 0.1 and 1 ac, or is it in a mosaic of wetlands that is between 0.1 and 1 ac?

[ ] Yes = Category III  [ ] No = Category IV

**Category of wetland based on Special Characteristics**

If you answered No for all types, enter “Not Applicable” on Summary Form

RATING SUMMARY – Western Washington

Name of wetland: Totem Lake  Date of site visit: 4/26/2017
Rated by: Kahlo, R  Trained by Ecology? ☒ Y ☐ N  Date of training: 09/2014

HGM Class used for rating: Depressional  Wetland has multiple HGM classes? ☒ Y ☐ N

NOTE: Form is not complete without the figures requested (figures can be combined).
Source of base aerial photo/map: King County iMAP

OVERALL WETLAND CATEGORY (based on functions ☒ or special characteristics ☐)

1. Category of wetland based on FUNCTIONS
   ☐ Category I – Total score = 23 - 27
   ☒ Category II – Total score = 20 - 22
   ☐ Category III – Total score = 16 - 19
   ☐ Category IV – Total score = 9 - 15

HGM Classification of Wetlands in Western Washington

For questions 1-7, the criteria described must apply to the entire unit being rated.

If the hydrologic criteria listed in each question do not apply to the entire unit being rated, you probably have a unit with multiple HGM classes. In this case, identify which hydrologic criteria in questions 1-7 apply, and go to Question 8.

1. Are the water levels in the entire unit usually controlled by tides except during floods?
   ☒ NO – go to 2
   ☐ YES – the wetland class is Tidal Fringe – go to 1.1

1.1 Is the salinity of the water during periods of annual low flow below 0.5 ppt (parts per thousand)?
   NO – Saltwater Tidal Fringe (Estuarine)  YES – Freshwater Tidal Fringe
   If your wetland can be classified as a Freshwater Tidal Fringe use the forms for Riverine wetlands. If it is Saltwater Tidal Fringe it is an Estuarine wetland and is not scored. This method cannot be used to score functions for estuarine wetlands.

2. The entire wetland unit is flat and precipitation is the only source (>90%) of water to it. Groundwater and surface water runoff are NOT sources of water to the unit.
   ☒ NO – go to 3
   ☐ YES – The wetland class is Flats
   If your wetland can be classified as a Flats wetland, use the form for Depressional wetlands.

3. Does the entire wetland unit meet all of the following criteria?
   ☐ The vegetated part of the wetland is on the shores of a body of permanent open water (without any plants on the surface at any time of the year) at least 20 ac (8 ha) in size;
   ☒ At least 30% of the open water area is deeper than 6.6 ft (2 m).
   ☒ NO – go to 4
   ☐ YES – The wetland class is Lake Fringe (Lacustrine Fringe)

4. Does the entire wetland unit meet all of the following criteria?
   ☐ The wetland is on a slope (slope can be very gradual),
   ☐ The water flows through the wetland in one direction (unidirectional) and usually comes from seeps. It may flow subsurface, as sheetflow, or in a swale without distinct banks,
   ☐ The water leaves the wetland without being impounded.
   ☒ NO – go to 5
   ☐ YES – The wetland class is Slope
   NOTE: Surface water does not pond in these type of wetlands except occasionally in very small and shallow depressions or behind hummocks (depressions are usually <3 ft diameter and less than 1 ft deep).

5. Does the entire wetland unit meet all of the following criteria?
   ☐ The unit is in a valley, or stream channel, where it gets inundated by overbank flooding from that stream or river,
   ☐ The overbank flooding occurs at least once every 2 years.
Wetland name or number: Totem Lake

☒ NO – go to 6

☐ YES – The wetland class is Riverine

NOTE: The Riverine unit can contain depressions that are filled with water when the river is not flooding

6. Is the entire wetland unit in a topographic depression in which water ponds, or is saturated to the surface, at some time during the year? This means that any outlet, if present, is higher than the interior of the wetland.

☐ NO – go to 7

☒ YES – The wetland class is Depressional

7. Is the entire wetland unit located in a very flat area with no obvious depression and no overbank flooding? The unit does not pond surface water more than a few inches. The unit seems to be maintained by high groundwater in the area. The wetland may be ditched, but has no obvious natural outlet.

☐ NO – go to 8

☒ YES – The wetland class is Depressional

8. Your wetland unit seems to be difficult to classify and probably contains several different HGM classes. For example, seeps at the base of a slope may grade into a riverine floodplain, or a small stream within a Depressional wetland has a zone of flooding along its sides. GO BACK AND IDENTIFY WHICH OF THE HYDROLOGIC REGIMES DESCRIBED IN QUESTIONS 1-7 APPLY TO DIFFERENT AREAS IN THE UNIT (make a rough sketch to help you decide). Use the following table to identify the appropriate class to use for the rating system if you have several HGM classes present within the wetland unit being scored.

NOTE: Use this table only if the class that is recommended in the second column represents 10% or more of the total area of the wetland unit being rated. If the area of the HGM class listed in column 2 is less than 10% of the unit; classify the wetland using the class that represents more than 90% of the total area.

<table>
<thead>
<tr>

</tr>
<tr>
<td>Riverine + Lake Fringe</td>
<td>Riverine</td>
</tr>
<tr>
<td>Salt Water Tidal Fringe and any other class of freshwater wetland</td>
<td>Treat as ESTUARINE</td>
</tr>
</tbody>
</table>

If you are still unable to determine which of the above criteria apply to your wetland, or if you have more than 2 HGM classes within a wetland boundary, classify the wetland as Depressional for the rating.

**DEPRESSIONAL AND FLATS WETLANDS**

### Hydrologic Functions - Indicators that the site functions to reduce flooding and stream degradation

**D 4.0. Does the site have the potential to reduce flooding and erosion?**

**D 4.1. Characteristics of surface water outflows from the wetland:**
- Wetland is a depression or flat depression with no surface water leaving it (no outlet)  
  points = 4
- Wetland has an intermittently flowing stream or ditch, OR highly constricted permanently flowing outlet  
  points = 2
- Wetland is a flat depression (QUESTION 7 on key), whose outlet is a permanently flowing ditch  
  points = 1
- Wetland has an unconfined, or slightly constricted, surface outlet that is permanently flowing  
  points = 0

**D 4.2. Depth of storage during wet periods:**
- Estimate the height of ponding above the bottom of the outlet. For wetlands with no outlet, measure from the surface of permanent water or if dry, the deepest part.
  - Marks of ponding are 3 ft or more above the surface or bottom of outlet  
    points = 7
  - Marks of ponding between 2 ft to < 3 ft from surface or bottom of outlet  
    points = 5
  - Marks are at least 0.5 ft to < 2 ft from surface or bottom of outlet  
    points = 3
  - The wetland is a “headwater” wetland  
    points = 3
  - Wetland is flat but has small depressions on the surface that trap water  
    points = 1
  - Marks of ponding less than 0.5 ft (6 in)  
    points = 0

**D 4.3. Contribution of the wetland to storage in the watershed:**
- Estimate the ratio of the area of upstream basin contributing surface water to the wetland to the area of the wetland unit itself.
  - The area of the basin is less than 10 times the area of the unit  
    points = 5
  - The area of the basin is 10 to 100 times the area of the unit  
    points = 3
  - The area of the basin is more than 100 times the area of the unit  
    points = 0
  - Entire wetland is in the Flats class  
    points = 5

Total for D 4: Add the points in the boxes above  10

**Rating of Site Potential**
- If score is: ☒ 12-16 = H ☒ 6-11 = M ☒ 0-5 = L
- Record the rating on the first page

**D 5.0. Does the landscape have the potential to support hydrologic functions of the site?**

**D 5.1. Does the wetland receive stormwater discharges?**
- Yes = 1  
  No = 0

**D 5.2. Is >10% of the area within 150 ft of the wetland in land uses that generate excess runoff?**
- Yes = 1  
  No = 0

**D 5.3. Is more than 25% of the contributing basin of the wetland covered with intensive human land uses (residential at >1 residence/ac, urban, commercial, agriculture, etc.)?**
- Yes = 1  
  No = 0

Total for D 5: Add the points in the boxes above  3

**Rating of Landscape Potential**
- If score is: ☒ 3 = H ☒ 1 or 2 = M ☒ 0 = L
- Record the rating on the first page

**D 6.0. Are the hydrologic functions provided by the site valuable to society?**

**D 6.1. The unit is in a landscape that has flooding problems.**
- Choose the description that best matches conditions around the wetland unit being rated. Do not add points. Choose the highest score if more than one condition is met.
  - The wetland captures surface water that would otherwise flow down-gradient into areas where flooding has damaged human or natural resources (e.g., houses or salmon redds):
    - Flooding occurs in a sub-basin that is immediately down-gradient of unit.  
      points = 2
    - Surface flooding problems are in a sub-basin farther down-gradient.  
      points = 1
    - Flooding from groundwater is an issue in the sub-basin.  
      points = 1
  - The existing or potential outflow from the wetland is so constrained by human or natural conditions that the water stored by the wetland cannot reach areas that flood. *Explain why______________*  
    points = 0
  - There are no problems with flooding downstream of the wetland.  
    points = 0

**D 6.2. Has the site been identified as important for flood storage or flood conveyance in a regional flood control plan?**
- Yes = 2  
  No = 0

Total for D 6: Add the points in the boxes above  4

**Rating of Value**
- If score is: ☒ 2-4 = H ☒ 1 = M ☒ 0 = L
- Record the rating on the first page

<td>☒ Invasive plants cover less than 25% of the wetland area in every stratum of plants <em>(see H 1.1 for list of strata)</em></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Total for H 1: Add the points in the boxes above 14

### H 2.0. Does the landscape have the potential to support the habitat functions of the site?

#### H 2.1. Accessible habitat (include only habitat that directly abuts wetland unit).

*Calculate:* % undisturbed habitat: \( 4 + \left( \frac{\% \text{ moderate and low intensity land uses}}{2} \right) \) : 0 = 4% If total accessible habitat is:

- > 1/3 (33.3%) of 1 km Polygon, points = 3 0
- 20-33% of 1 km Polygon, points = 2 0
- 10-19% of 1 km Polygon, points = 1 0
- < 10% of 1 km Polygon, points = 0 0

Total for H 2: Add the points in the boxes above -2

#### H 2.2. Undisturbed habitat in 1 km Polygon around the wetland.

*Calculate:* % undisturbed habitat: \( 7 + \left( \frac{\% \text{ moderate and low intensity land uses}}{2} \right) \) : 0 = 7%

- Undisturbed habitat > 50% of Polygon, points = 3 0
- Undisturbed habitat 10-50% and in 1 to 3 patches, points = 2 0
- Undisturbed habitat 10-50% and > 3 patches, points = 1 0
- Undisturbed habitat < 10% of 1 km Polygon, points = 0 0

#### H 2.3. Land use intensity in 1 km Polygon: If

- > 50% of 1 km Polygon is high intensity land use, points = (-2) -2
- ≤ 50% of 1 km Polygon is high intensity, points = 0 0

Total for H 2: Add the points in the boxes above -2

### H 3.0. Is the habitat provided by the site valuable to society?

#### H 3.1. Does the site provide habitat for species valued in laws, regulations, or policies? Choose only the highest score that applies to the wetland being rated.

Site meets ANY of the following criteria:

- ☒ It has 3 or more priority habitats within 100 m (see next page) points = 2
- ☐ It provides habitat for Threatened or Endangered species (any plant or animal on the state or federal lists) points = 2
- ☐ It is mapped as a location for an individual WDFW priority species points = 2
- ☐ It is a Wetland of High Conservation Value as determined by the Department of Natural Resources points = 2
- ☐ It has been categorized as an important habitat site in a local or regional comprehensive plan, in a Shoreline Master Plan, or in a watershed plan points = 2
- Site has 1 or 2 priority habitats (listed on next page) within 100 m points = 1
- Site does not meet any of the criteria above points = 0

Rating of Value: If score is: ☒2 = H ☐1 = M ☐0 = L Record the rating on the first page

Wetland Rating System for Western WA: 2014 Update
Rating Form – Effective January 1, 2015
Wetland name or number: Totem Lake

**WDFW Priority Habitats**

Count how many of the following priority habitats are within 330 ft (100 m) of the wetland unit: **NOTE:** This question is independent of the land use between the wetland unit and the priority habitat.

☐ **Aspen Stands:** Pure or mixed stands of aspen greater than 1 ac (0.4 ha).

☐ **Biodiversity Areas and Corridors:** Areas of habitat that are relatively important to various species of native fish and wildlife (full descriptions in WDFW PHS report).

☐ **Herbaceous Balds:** Variable size patches of grass and forbs on shallow soils over bedrock.

☐ **Old-growth/Mature forests:** Old-growth west of Cascade crest – Stands of at least 2 tree species, forming a multi-layered canopy with occasional small openings; with at least 8 trees/ ac (20 trees/ ha) > 32 in (81 cm) dbh or > 200 years of age. Mature forests – Stands with average diameters exceeding 21 in (53 cm) dbh; crown cover may be less than 100%; decay, decadence, numbers of snags, and quantity of large downed material is generally less than that found in old-growth; 80-200 years old west of the Cascade crest.

☐ **Oregon White Oak:** Woodland stands of pure oak or oak/conifer associations where canopy coverage of the oak component is important (full descriptions in WDFW PHS report p. 158 – see web link above).

☒ **Riparian:** The area adjacent to aquatic systems with flowing water that contains elements of both aquatic and terrestrial ecosystems which mutually influence each other.

☐ **Westside Prairies:** Herbaceous, non-forested plant communities that can either take the form of a dry prairie or a wet prairie (full descriptions in WDFW PHS report p. 161 – see web link above).

☒ **Instream:** The combination of physical, biological, and chemical processes and conditions that interact to provide functional life history requirements for instream fish and wildlife resources.

☐ **Nearshore:** Relatively undisturbed nearshore habitats. These include Coastal Nearshore, Open Coast Nearshore, and Puget Sound Nearshore. (full descriptions of habitats and the definition of relatively undisturbed are in WDFW report – see web link on previous page).

☐ **Caves:** A naturally occurring cavity, recess, void, or system of interconnected passages under the earth in soils, rock, ice, or other geological formations and is large enough to contain a human.

☐ **Cliffs:** Greater than 25 ft (7.6 m) high and occurring below 5000 ft elevation.

☐ **Talus:** Homogenous areas of rock rubble ranging in average size 0.5 - 6.5 ft (0.15 - 2.0 m), composed of basalt, andesite, and/or sedimentary rock, including riprap slides and mine tailings. May be associated with cliffs.

☒ **Snags and Logs:** Trees are considered snags if they are dead or dying and exhibit sufficient decay characteristics to enable cavity excavation /use by wildlife. Priority snags have a diameter at breast height of > 20 in (51 cm) in western Washington and are > 6.5 ft (2 m) in height. Priority logs are > 12 in (30 cm) in diameter at the largest end, and > 20 ft (6 m) long.

**Note:** All vegetated wetlands are by definition a priority habitat but are not included in this list because they are addressed elsewhere.

<tr>
<td><strong>SC 1.2. Is the wetland unit at least 1 ac in size and meets at least two of the following three conditions?</strong></td>
<td>Cat. I, Cat. II</td>
</tr>
<tr>
<td>☐ The wetland is relatively undisturbed (has no diking, ditching, filling, cultivation, grazing, and has less than 10% cover of non-native plant species. (If non-native species are Spartina, see page 25)</td>
<td></td>
</tr>
<tr>
<td>☐ At least ½ of the landward edge of the wetland has a 100 ft buffer of shrub, forest, or un-grazed or un-mowed grassland.</td>
<td></td>
</tr>
<tr>
<td>☐ The wetland has at least two of the following features: tidal channels, depressions with open water, or contiguous freshwater wetlands.</td>
<td>☐ Yes = <strong>Category I</strong> ☒ No = <strong>Category II</strong></td>
</tr>
<tr>
<td><strong>SC 2.0. Wetlands of High Conservation Value (WHCV)</strong></td>
<td></td>
</tr>
<tr>
<td>SC 2.1. Has the WA Department of Natural Resources updated their website to include the list of Wetlands of High Conservation Value?</td>
<td>☐ Yes – Go to <strong>SC 2.2</strong> ☒ No – Go to <strong>SC 2.3</strong></td>
</tr>
<tr>
<td>SC 2.2. Is the wetland listed on the WDNR database as a Wetland of High Conservation Value?</td>
<td>☐ Yes = <strong>Category I</strong> ☒ No = <strong>Not a WHCV</strong></td>
</tr>
<tr>
<td>SC 2.3. Is the wetland in a Section/Township/Range that contains a Natural Heritage wetland?</td>
<td>☐ Yes – Contact WNHP/WDNR and go to <strong>SC 2.4</strong> ☒ No = <strong>Not a WHCV</strong></td>
</tr>
<tr>
<td>SC 2.4. Has WDNR identified the wetland within the S/T/R as a Wetland of High Conservation Value and listed it on their website?</td>
<td>☐ Yes = <strong>Category I</strong> ☒ No = <strong>Not a WHCV</strong></td>
</tr>
<tr>
<td><strong>SC 3.0. Bogs</strong></td>
<td></td>
</tr>
<tr>
<td>Does the wetland (or any part of the unit) meet both the criteria for soils and vegetation in bogs? <em>Use the key below. If you answer YES you will still need to rate the wetland based on its functions.</em></td>
<td></td>
</tr>
<tr>
<td>SC 3.1. Does an area within the wetland unit have organic soil horizons, either peats or mucks, that compose 16 in or more of the first 32 in of the soil profile?</td>
<td>☒ Yes – Go to <strong>SC 3.3</strong> ☐ No – Go to <strong>SC 3.2</strong></td>
</tr>
<tr>
<td>SC 3.2. Does an area within the wetland unit have organic soils, either peats or mucks, that are less than 16 in deep over bedrock, or an impermeable hardpan such as clay or volcanic ash, or that are floating on top of a lake or pond?</td>
<td>☐ Yes – Go to <strong>SC 3.3</strong> ☒ No = <strong>Is not a bog</strong></td>
</tr>
<tr>
<td>SC 3.3. Does an area with peats or mucks have more than 70% cover of mosses at ground level, AND at least a 30% cover of plant species listed in Table 4?</td>
<td>☐ Yes = <strong>Is a Category I bog</strong> ☒ No – Go to <strong>SC 3.4</strong></td>
</tr>
<tr>
<td><strong>NOTE:</strong> If you are uncertain about the extent of mosses in the understory, you may substitute that criterion by measuring the pH of the water that seeps into a hole dug at least 16 in deep. If the pH is less than 5.0 and the plant species in Table 4 are present, the wetland is a bog.</td>
<td></td>
</tr>
<tr>
<td>SC 3.4. Is an area with peats or mucks forested (&gt; 30% cover) with Sitka spruce, subalpine fir, western red cedar, western hemlock, lodgepole pine, quaking aspen, Engelmann spruce, or western white pine, AND any of the species (or combination of species) listed in Table 4 provide more than 30% of the cover under the canopy?</td>
<td>☐ Yes = <strong>Is a Category I bog</strong> ☒ No = <strong>Is not a bog</strong></td>
</tr>
</tbody>
</table>
## SC 4.0. Forested Wetlands

Does the wetland have at least 1 contiguous acre of forest that meets one of these criteria for the WA Department of Fish and Wildlife’s forests as priority habitats? *If you answer YES you will still need to rate the wetland based on its functions.*

- Old-growth forests (west of Cascade crest): Stands of at least two tree species, forming a multi-layered canopy with occasional small openings; with at least 8 trees/ac (20 trees/ha) that are at least 200 years of age OR have a diameter at breast height (dbh) of 32 in (81 cm) or more.
- Mature forests (west of the Cascade Crest): Stands where the largest trees are 80-200 years old OR the species that make up the canopy have an average diameter (dbh) exceeding 21 in (53 cm).

- Yes = **Category I**  □ No = **Not a forested wetland for this section**

## SC 5.0. Wetlands in Coastal Lagoons

Does the wetland meet all of the following criteria of a wetland in a coastal lagoon?

- The wetland lies in a depression adjacent to marine waters that is wholly or partially separated from marine waters by sandbanks, gravel banks, shingle, or, less frequently, rocks
- The lagoon in which the wetland is located contains ponded water that is saline or brackish (> 0.5 ppt) during most of the year in at least a portion of the lagoon (*needs to be measured near the bottom*)

- Yes – Go to **SC 5.1**  □ No = **Not a wetland in a coastal lagoon**

### SC 5.1. Does the wetland meet all of the following three conditions?

- The wetland is relatively undisturbed (has no diking, ditching, filling, cultivation, grazing), and has less than 20% cover of aggressive, opportunistic plant species (see list of species on p. 100).
- At least ¾ of the landward edge of the wetland has a 100 ft buffer of shrub, forest, or un-grazed or un-mowed grassland.
- The wetland is larger than ¼ ac (4350 ft²)

- Yes = **Category I**  □ No = **Category II**

## SC 6.0. Interdunal Wetlands

Is the wetland west of the 1889 line (also called the Western Boundary of Upland Ownership or WBUO)? *If you answer yes you will still need to rate the wetland based on its habitat functions.*

In practical terms that means the following geographic areas:

- Long Beach Peninsula: Lands west of SR 103
- Grayland-Westport: Lands west of SR 105
- Ocean Shores-Copalis: Lands west of SR 115 and SR 109

- Yes – Go to **SC 6.1**  □ No = **not an interdunal wetland for rating**

### SC 6.1. Is the wetland 1 ac or larger and scores an 8 or 9 for the habitat functions on the form (rates H,H,H or H,H,M for the three aspects of function)?

- Yes = **Category I**  □ No – Go to **SC 6.2**

### SC 6.2. Is the wetland 1 ac or larger, or is it in a mosaic of wetlands that is 1 ac or larger?

- Yes = **Category II**  □ No – Go to **SC 6.3**

### SC 6.3. Is the unit between 0.1 and 1 ac, or is it in a mosaic of wetlands that is between 0.1 and 1 ac?

- Yes = **Category III**  □ No = **Category IV**

## Category of wetland based on Special Characteristics

If you answered No for all types, enter “Not Applicable” on Summary Form

**NA**

### HYDROLOGY

**Wetland Hydrology Indicators:**

Primary indicators (minimum of one required; check all that apply)

- [ ] Surface Water (A1)
- [x] High Water Table (A2)
- [ ] Saturation (A3)
- [ ] Water Marks (B1)
- [ ] Sediment Deposits (B2)
- [ ] Drift Deposits (B3)
- [ ] Algal Mat or Crust (B4)
- [ ] Iron Deposits (B5)
- [ ] Surface Soil Cracks (B6)
- [ ] Inundation Visible on Aerial Imagery (B7)
- [ ] Sparcely Vegetated Concave Surface (B8)

Secondary indicators (2 or more required)

- [ ] Water-Stained Leaves (B9) (MLRA 1, 2, 4A, and 4B)
- [ ] Salt Crust (B11)
- [ ] Aquatic Invertebrates (B13)
- [ ] Hydrogen Sulfide Odor (C1)
- [ ] Oxidized Rhizospheres along Living Roots (C3)
- [ ] Presence of Reduced Iron (C4)
- [ ] Recent Iron Reduction in Tilled Soils (C6)
- [ ] Stunted or Stressed Plants (D1) (LRR A)
- [ ] Other (Explain in Remarks)

**Secondary Indicators (2 or more required):**

- [ ] Water-Stained Leaves (B9) (MLRA 1, 2, 4A, and 4B)
- [ ] Drainage Patterns (B10)
- [ ] Dry-Season Water Table (C2)
- [ ] Saturation Visible on Aerial Imagery (C3)
- [ ] Geomorphic Position (D2)
- [ ] Shallow Aquitard (D3)
- [ ] FAC-Neutral Test (D6)
- [ ] Raised Ant Mounds (D6) (LRR A)
- [ ] Frost-Heave Hummocks (D7)

**Field Observations:**

- Surface Water Present? Yes ☑ No ☐ Depth (inches): 
- Water Table Present? Yes ☑ No ☐ Depth (inches): 18
- Saturation Present? Yes ☑ No ☐ Depth (inches): 

**Wetland Hydrology Present?** Yes ☑ No ☐

**Remarks:**

Soils noted in lower layer, likely saturated in spring season. Surface ponding present, 10' of DP.

#### Hydric Soil Indicators: (Applicable to all LRRs, unless otherwise noted.)

- Histosol (A1)
- Histic Epipedon (A2)
- Black Histic (A3)
- Hydrogen Sulfide (A4)
- Depleted Below Dark Surface (A11)
- Thick Dark Surface (A12)
- Sandy Mucky Mineral (S1)
- Sandy Gleyed Matrix (S4)

#### Indicators for Problematic Hydric Soils²:

- 2 cm Muck (A10)
- Red Parent Material (TF2)
- Very Shallow Dark Surface (TF12)
- Other (Explain in Remarks)

#### Restrictive Layer (if present):

- Type: cobbles/fill  
- Depth (inches): 8”

#### HYDROLOGY

**Wetland Hydrology Indicators:**

**Primary Indicators (minimum of one required; check all that apply)**

- Surface Water (A1)
- High Water Table (A2)
- Saturation (A3)
- Water Marks (B1)
- Sediment Deposits (B2)
- Drift Deposits (B3)
- Algal Mat or Crust (B4)
- Iron Deposits (B5)
- Surface Soil Cracks (B6)
- Inundation Visible on Aerial Imagery (B7)
- Sparsely Vegetated Concave Surface (B8)

**Secondary Indicators (2 or more required)**

- Water-Stained Leaves (B9)
- Salt Crust (B11)
- Aquatic Invertebrates (B13)
- Hydrogen Sulfide Odor (C1)
- Oxidized Rhizospheres along Living Roots (C3)
- Presence of Reduced Iron (C4)
- Recent Iron Reduction in Tilled Soils (C6)
- Stunted or Stresses Plants (D1) (LRR A)
- Other (Explain in Remarks)

**Field Observations:**

- Surface Water Present? Yes ☐ No ☑  
- Water Table Present? Yes ☐ No ☑  
- Saturation Present? Yes ☐ No ☑  

**Wetland Hydrology Present?** Yes ☐ No ☑

Appendix E:
Arborist Reports and Tree Plans
Dear Mr. Martenson,

Property at 12031 NE Totem Lake Way in Kirkland Washington (KC Parcel #692840-0032) is north of Totem Lake and contains a retail store, and vehicle parking. Mature trees are part of landscaping on the property. King County (KC) Conservation District (KC Parcel #866372-0060) that surrounds Totem Lake is both south and east of the property. In addition property containing a motel (KC Parcel #866372-0010) is to the east.

Plans call for developing the 12031 property. Since mature trees are present, a tree inventory and an analysis of trees suitable for retention was requested.

On December 4th to 6th 2017 Kurt Fickeisen from Symbiosis Tree Care came to the property and evaluated trees on and around the property (Figure-1).

This letter contains a report that provides a tree inventory, information on tree condition, and a list of trees suitable for retention. Please see Assumptions Limiting Conditions for this report on the last page.

**Summary**

Plans call for developing property at 12031 NE Totem Lake Way in Kirkland Washington. 79 trees with diameters over 6-inches grow on the property.

At least one tree located on Totem Lake Way and north of the current building should be removed. Other trees in this area may be preserved if tree protection is possible.

On the eastern side of the building trees within the KC Conservation should be considered for preservation, but trees in close proximity to the building should be removed.

South of paved parking trees with canopies extending over parking should be considered for removal if excavation under tree canopies is required.

All trees within the parking lot and south of the existing building should be removed.
Observations

Tree inspection starts on the northwest corner of the property and travels eastward along Totem Lake Way. Once reaching the KC Conservation District inspection travels southward and then westward along the 12031 property border. The last tree grouping inspected is those adjacent to the existing parking lot. Figure-2 provides a map of tree inventory (Figure-2).

Trees along Totem Lake Way

A file with information on all trees over 6-inches diameter is provided in a spreadsheet (Figure-3A). This spreadsheet provides information on tree: species, size, vigor, condition, and comments. Photos of trees are also provided (Photo-1 – Photo-3).

Fifteen trees are located parallel to Totem Lake Way. The majority are red maples (*Acer rubrum*), but a black cottonwood (*Populus trichocarpa*) is planted adjacent to the street. In addition ornamental plum/cherries (*Prunus Sp.*) are present along with small diameter Douglas firs (*Pseudotsuga menziesii*).

Most trees have been pruned to provide street and sidewalk clearance, however the red maple numbered 8 has been pruned to provide building clearance

- Tree-8 may not classify as a street tree due to sidewalk setback
- Tree-15 is east of a paved trail on KC Conservation District property

Tree roots may conflict with the existing sidewalk and curb since the canopy overhangs the sidewalk. In addition tree 5 and 12 are in close proximity to utility boxes.

Three additional trees numbered 16 to 18 are north of the building but are set back from the street and sidewalk. One is a pacific madrone (*Arbutus menziesii*). The remaining two are red pines (*Pinus resinosa*).

- A minor amount of pruning has been performed on pine trees to provide building clearance

Trees North of the 12031 Building

Some trees north of the 12031 building are on the property, but others are within the KC Conservation District or on property containing a motel. Information on tree characteristics is provided in two spreadsheets (Figure-3A, Figure-3B). Additional information is provided below by tree number.

Numbers 19 to 21 consist of two red pines and one Deodar cedar (*Cedrus deodar*). The trees are on the 12031 property and located on or adjacent to a deck attached to the building. While both pines show signs of good vigor and condition the Deodar is shaded by adjacent trees (Photo-3)

- All three trees are in close proximity to building structures
Numbers 22 to 29 consist of Lombardy poplars (*Populus nigra*) and are marked in Photo-3. All eight poplars are in close proximity to the 12031 building.

Numbers 30 to 34 are north of a paved walkway on the KC Conservation District. Trees consist of black cottonwoods and a columnar variety of beach tree (*Fagus sylvatica*).

Numbers 35 to 40 are red pines south of the Lombardy poplar group and adjacent to the 12031 building (Photo-4). All are in close proximity to the 12031 building.

Numbers 41 to 50 are adjacent to the KC Conservation District property and two paved and connected trails. Trees in this group consist of red alders (*Alnus rubra*), black cottonwoods, Douglas firs (*Pseudotsuga menziesii*), and a red maple.

All trees are in fair condition at this time however:

- Tree 43 leans northward towards the trail
- Trees numbered 48 to 50 are at the edge of an area with visible wetlands

Site conditions may impact long term health and stability of tree 48 and 49 since Douglas fir trees prefer well drained soils (Photo-6).

The black cottonwood, number 47, is marked in Photo-5 along with a tree east of inspected trees in this report (Photo-5).

Trees South and Southeast of 12031 Pavement

Trees in this set form a grouping south and west of paved parking and act as a buffer between the wetland and an adjacent property (Photo-7 to Photo-9). Tree characteristics are provided in a spreadsheet (Figure-3C). Additional information is provided below by tree number.

Number 51 is a mature red maple growing in a peninsula of soil. Pavement surrounded the soil bed and tree root growth has fractured pavement under the canopy.

Numbers 52 to 55 are young red alders located between a wetland and pavement. The trees appear in fair condition

- Small diameter western red cedars (*Thuja plicata*) grow under alder canopies

Numbers 56 to 59 are mature red maples located between the wetland and pavement. All trees have codominant growth patterns and northern sections of tree canopies overhang paved parking. While there are no visible signs of root growth under pavement, the area is a likely location for significant tree root growth.

- Small diameter western red cedars grow under the canopy of red maples 56 to 58
Numbers 60 to 63 are primarily red maples, but one black cottonwood is part of this group. All trees are mature and in close proximity to pavement. While maples contain single trunks at grade level, the cottonwood consists of five individual trunks joined at root crown level

- Based on proximity of structural roots to pavement, root-pavement conflicts are likely to be present

Planting Strip Trees

Planting strip trees are directly west of the structure on the 12031 property. All are mature trees with small statures and are surrounded by pavement under at least 50-percent of the canopy (Photo-8). All have been pruned to provide clearance for vehicles and pedestrians. Tree characteristics are provided in a spreadsheet (Figure-3C). Additional information is provided below by tree number.

Numbers 64 to 66 consist of two flowering cherry trees and one Alaska red cedar (Chamaecyparis nootkatensis). All are directly west of the property building and entirely surrounded by pavement.

Numbers 67 to 68 consist of one flowering cherry and one red maple. Both trunks are in close proximity to the northern edge of the parking lot.

Numbers 69 to 79 consist primarily of crabapple trees, but three flowering cherries are part of the group. All trees are located in a planting bed between parking spaces (Photo-9). Three members of this group contain numerous stump sprouts.

Discussion

Trees along Totem Lake Way

Most trees in this group are in close proximity to the sidewalk and street. While most are acceptable in parking strip locations, the black cottonwood (Tree-1) is not approved by most municipalities for planting strip location

- If road, sidewalk, utility box, and soil excavation work is not part of upcoming development, tree protection is possible

Remaining trees in this group are set back from the street and building. These include

- Tree-8
- Tree-16 to Tree-18

All have been pruned for building clearance and roots do not appear in close proximity to the building.
These trees can be protected during construction if the future building footprint construction does not come within 5-feet of trunks and root pruning is performed if conflicts are present.

Trees North of the 12031 Building

A significant number of these trees are in close proximity to the existing building, but other trees are east or south of the walkway traveling through the KC Conservation District.

Based on proximity to existing structures retention of the following trees is not recommended

- Red pines numbered 19-20 and 35-40
- Deodar cedar numbered 21
- Lombardy poplar numbered 22 -29

If no construction or construction related impact takes place east or south of the conservation district walkway and within 18-feet of the trunk of the red maple (#50) then trees can be retained, however additional monitoring is recommended.

Trees South and Southeast of 12031 Pavement

Most trees in this group are in close proximity to existing pavement. Based on root buckling observed adjacent to the red maple numbered 51, retention should not be considered unless no pavement excavation is planned during construction.

On the other hand preservation of red alders numbered 52 to 55 along with small diameter western red cedars south of paved surfaces and under alder and maple canopies should be considered.

Planting Strip Trees

All trees in this group are in close proximity to infrastructure that will be impacted by future construction. Based on space requirements for common construction equipment and material storage, trees in the planting strip should not be retained.

Conclusion

Retention of trees east of the KC Conservation District walkway is recommended. Preservation of the following trees should be considered if protection during construction is possible

- Street trees along Totem Lake Way, and or north of the existing building
- The grove of alders numbered 52 to 55 and adjacent small diameter western red cedars

Removal of other inspected trees is recommended.
**Recommendations**

The black cottonwood (#1) is the only street tree where removal is recommended in all cases.

If existing sidewalks will be retained and tree protection fencing is installed during construction, then street trees preservation is possible.

Preservation of the red maple (#8), the pacific madrone (#16) and red pines (#17-18) should be considered if tree canopies do not conflict with construction plans and protection fencing is installed during construction.

All trees east of the trail and on KC Conservation District Property should be retained and monitored.

Preservation of red alders (#52 to #55) and small diameter western red cedars is possible if protection fencing is installed during construction

- Small diameter western red cedars should receive additional protection during removal of adjacent red maples.

**Tree Protection Fencing**

When installing protection fencing the material should be located at distance from the trunk equivalent to the radial spread listed in all segments of Figure-3.

If distances for protection fencing are not possible an International Society of Arboriculture Certified Arborist can evaluate root growth patterns and provide protection fencing alternatives.

- Retained sidewalk can be used to mark protection fencing locations
- General diagrams for tree protection fencing are provided (Figure-4A, Figure-4B)

If you have questions about the contents of this report contact Symbiosis Tree Care.

Sincerely

---

9. Sketches, diagrams, graphs, and photographs in this report, being intended as visual aids, are not necessarily to scale and should not be construed as engineering or architectural reports or surveys.

10. Unless expressed otherwise: 1) information contained in this report covers only those items that were examined and reflects the condition of those items at the time of inspection, and 2) the inspection is limited to visual examination of accessible items without dissection, excavation, probing, or coring.

11. There is no warranty or guarantee, expressed or implied that problems or deficiencies of the tree or other plant or property in question may not arise in the future.

12. The right is reserved to adjust tree valuations, if additional relevant information is made available.
Matt Martenson  
Berger Partnership  
1721 8th Avenue N  
Seattle, WA 98109

December 13, 2017

Dear Mr. Martenson,

Property at 12031 NE Totem Lake Way in Kirkland Washington (KC Parcel #692840-0032) is north of Totem Lake and contains a retail store. Mature trees are part of landscaping on the property and are present in King County (KC) Conservation District (KC Parcel #866372-0060) that surrounds Totem Lake.

Plans call for developing the 12031 property and improving and expanding a community trail north and east of Totem Lake. This trail will travel eastward, cross the wetland, and connect to the existing Cross Kirkland Corridor Trail. Since mature trees are adjacent to the expanded trail location, evaluating tree condition and developing protection plans prior to the start of work was required.

On December 6th and 7th 2017 Kurt Fickeisen from Symbiosis Tree Care evaluated trees adjacent to the pathway (Figure-1). This letter contains a report that provides information on tree condition, and a guide for mitigating conflicts during trail installation. Please see Assumptions and Limitations for this report (Assumptions and Limitations).

Summary

An existing trail east of property at 12031 NE Totem Lake Way in Kirkland Washington will be improved and expanded to connect with the Cross Kirkland Corridor Trail. While trees grow in clusters east of the 12031 property, trees become a grove east of power lines crossing the area. The final segment of trees grows on a peninsula of land extending northward from the Cross Kirkland Corridor into a wetland.

North of the wetland removal or additional assessment of trees with signs of poor structure is recommended. In addition root pruning may take place where trees grow in clusters, but alternative methods of trail installation should be considered once trees enter a grove.

South of the wetland trees should be removed, retained at root crown level and allowed to grow from stump sprouts.
Observations

The pathway assessment starts adjacent to a wetland near the southeast corner of the 12031 property. The pathway travels eastward. Once reaching a location south of 12411 NE Totem Lake Way the trail will cross a wetland devoid of trees and joins the Cross Kirkland Corridor in a treed segment of land. Assessed trees are present in these two locations. 41 trees were evaluated along the pathway.

Trees North of the Wetland

Figure-2A marks trees north of the wetland (Figure-2A). 34 trees have diameters greater than 6-inches.

Trees 80 to 93 are west of overhead community power lines (Photo-1, Photo-2). Tree species present consist of black cottonwoods (*Populus trichocarpa*), big leaf maples (*Acer macrophyllum*), Douglas firs (*Pseudotsuga menziesii*) and native willows (*Salix Sp.*).

Information on all trees over 6-inches diameter is provided in a spreadsheet (Figure-3A). This spreadsheet provides tree: species, size, vigor, condition, and comments.

All trees show signs of fair vigor. While tree structure is fair in many trees the following trees show signs of poor structure

- Willow: 84, 85
- Black cottonwood: 87, 88, 90

Most large diameter roots do not appear to interfere with the existing trail.

Trees 94 to 97 are under or in close proximity to overhead community power lines. All trees show signs of fair vigor. While tree vigor is fair, the following trees show signs of poor structure

- Willow: 94
- Red alder: 96

Most large diameter roots do not appear to interfere with the existing trail.

Trees 98 to 103 are east of overhead community power lines. All trees show signs of fair vigor (Photo-3).

While tree structure is fair in some trees, the following show signs of poor structure

- Willow: 98, 103
- Red alder: 99, 100

Most large diameter roots do not appear to interfere with the existing trail.
Trees 104 to 113 primarily consist of mature black cottonwoods with heights near or over 100-feet (Photo-4). In this case tree information is provided in two spreadsheets (Figure-3A, Figure-3B).

While tree vigor and structure is fair in many trees the following trees show signs of poor structure

- Black cottonwoods 106, 111
  - As an example trunk decay is present near grade level on the northern side of Tree-111 (Photo-5)

In this case the current pathway travels within 5-feet of most trees and significant structural roots are present.

Trees South of the Wetland

Figure-2B marks trees south of the wetland (Figure-2B). Seven trees have diameters greater than 6-inches.

Trees 114 to 120 consist of red alders, willows, and one black hawthorn (*Crataegus douglasii*) tagged with the marker number 305. Information on all trees over 6-inches diameter is provided in a spreadsheet (Figure-3B).

All trees in this group show signs of fair vigor and structure with the exception of a willow (Tree-115). The willow shows signs of poor structure.

All trees are north of the Cross Kirkland Corridor. Installation of the trail involved addition of fill soil. In many cases nearby new red alder sprouts are emerging from the borders of new fill soil.

Discussion

At this time trail use is occasional. Trail use will increase once development on 12031 property take place, the trail surface is improved, and the trail connects to the Cross Kirkland Corridor.

Trees North of the Wetland

A risk assessment of trees showing signs of poor structure should be considered. While removal of poor structure trees is an option, tree removal will reduce shade provided by trees and the woodland environment that trail users may desire.

Between Tree-80 and Tree-105 conflicts between structural roots and the existing trail are present but minor

- In most cases root pruning should be considered as opposed to tree removal prior to trail surface improvements.
East of Tree-105 the trail enters a tree grove primarily consisting of mature cottonwoods until reaching the wetland. Due to the presence of a mature trees grove with signs of fair vigor and structure, **root pruning is not recommended.**

Options for trail improvement/installation include

- Establishing an elevated trail supported by post and pier anchors
- Installation of a gravel or cobble base layer at grade and use of permeable asphalt for human travel

**Trees South of the Wetland**

With the exception of the willow numbered 115 all trees evaluated in this group have diameters of 10-inches or less

- Both willows and red alders are short lived trees and are known to regenerate from undamaged stumps

Design plans for the future trail in this location are unknown, but soil addition is likely to be required based on construction techniques employed on the adjacent Cross Kirkland Corridor.

While a trail supported by a post and pier system is an option, trunks and canopies of most trees in this group conflict with a future pedestrian trail. In this case tree removal and root sprout regeneration is an option to consider.

**Conclusion**

Trees north of the wetland and showing signs of poor structure should be considered for either removal or additional assessment. In areas where trees grow in individual clusters root pruning is recommended. Once the trail enters the mature grove of trees alternatives should be considered prior to trail installation.

Trees south of the wetland appear to conflict with new trail establishment. Based on species most can be cut to grade level and allowed to regenerate from stump sprouts.

**Recommendations**

Removal of the following trees should be considered

- Black cottonwood: 87, 88, 90, 106, 111
- Red alder: 96, 99, 100
- Willows: 84, 85, 94, 98, 103
- All species south of the wetland

The City of Kirkland or King County may require additional assessment prior to removal. As an alternative, retention and monitoring should be considered.
Root Pruning

Between Tree-80 and Tree-105 tree roots over 2-inches diameter conflicting with the trail should be exposed and cut with reciprocating saws such as a, “sawzall”.

Root Bridging

Between Tree-106 and Tree-113 new trails should avoid damage to existing roots over 2-inches diameter. This may require placing the trail on a post and pier support or use of gravel and permeable asphalt

- While two options are provided in this report, there are additional strategies for infrastructure installation that mitigate root damage

If you have questions about the contents of this report contact Symbiosis Tree Care.

Sincerely

TREE REMOVAL GENERAL NOTES

Note # Description

1 FOR ALL TREES REMOVED ON SITE (SHEET ET101) ALL MATERIAL SHALL BE COMPLETELY REMOVED FROM SITE.

2 FOR ALL TREES REMOVED ON TRAIL SITE (SHEET ET102) FELL TREES DIRECIONALLY, SOUTH OF THE TRAIL SUCH THAT THE MAJORITY OF THE TREE LANDS SOUTH OF THE TRAIL IN THE BUFFER.

3 FOR ALL TREES REMOVED ON TRAIL AND BOARDWALK SITE ANY PORTION OF TREES FELLED FROM THE BUFFER THAT LAND IN THE WETLAND SHALL BE REMOVED FROM THE WETLAND.

4 FOR ALL TREES REMOVED ON TRAIL SITE (SHEET ET102) THAT OCCUR AT WITHIN BUFFER, FELL INTO BUFFER AND LEAVE. RELOCATE ANY PORTIONS OF THE TREE WHICH CONFLICT WITH PROPOSED HARDSCAPE ELEMENTS.

5 FOR ALL TREES REMOVED IN WETLAND AREAS, FELL TREE IN WETLAND AND LEAVE AS-IS. REMOVE/RELOCATE ANY PORTIONS WHICH CONFLICT WITH PROPOSED BOARDWALK.

6 FOR ALL TREES FELLED IN WETLAND AND BUFFER AREAS ON TRAIL AND BOARDWALK SITE (SHEET ET102 & ET103), TREES MAY BE SNAGGED AT 8' MAXIMUM HEIGHT IF THEY ARE LOCATED 10' OR GREATER FROM PROPOSED PATHWAYS, TRAILS, AND BOARDWALK.

7 FOR ALL TREES FELLED IN WETLAND AND BUFFER AREAS ON TRAIL AND BOARDWALK SITE (SHEET ET102 & ET103), LOCATED 10' OR LESS FROM PROPOSED PATHWAYS, TRAILS, AND BOARDWALK. CUT TRUNK W/N 1'-0" OF EXISTING GRADE.

8 FOR ALL SNAGGED TREES, JAGGED, BAYONET-STYLE CUTS PREFERRED TO FLAT CUTS FOR FELLED TREES THAT WILL BE LEFT IN THE BUFFER (AS SNAGS). BAYONET-STYLE CUTS MIMIC A NATURALLY-BROKEN TRUNK AND BENEFIT HABITAT CONDITIONS.

9 NO TREES OR SHRUBS OUTSIDE LIMIT OF WORK SHALL BE REMOVED.

10 TAG ALL TREES TO BE REMOVED PRIOR TO REMOVAL. CONFIRM WITH LANDSCAPE ARCHITECT. CONFIRM REMOVAL/RETAIN STATUS, FELLING/REMOVAL STATUS AND TREATMENT.

1.0 INTRODUCTION

At the request of the City of Kirkland (City), Environmental Science Associates has prepared this Federal Emergency Management Agency (FEMA) Floodplain Habitat Assessment for the Phase 1 of the Totem Lake Park Development (Project). The National Marine Fisheries Service’s (NMFS) Biological Opinion (BiOp) on the implementation of the National Flood Insurance Program (NFIP) in Puget Sound (dated September 22, 2008) requires local communities that do not have BiOp-compliant floodplain management ordinances to require and review a Habitat Assessment (HA) before approving a floodplain permit, in order demonstrate project compliance with the Endangered Species Act (ESA). Development of this HA is also a requirement per Kirkland Zoning Code (KZC) 21.56.055 to obtain a permit for construction or development within the special flood hazard area. This HA has been developed using the guidance of the FEMA Puget Sound BiOp Floodplain Habitat Assessment Worksheet (FEMA, 2017) and FEMA’s Floodplain Habitat Assessment and Mitigation: Regional Guidance Manual (FEMA, 2013).

2.0 PROJECT AREA DESCRIPTION

The proposed park improvements are located within Totem Lake Park, in the northeast portion of the City of Kirkland, King County, Washington (Section 28, Township 26N, Range 5E) (Figure 1). The project is located within the Juanita Creek basin, east of Interstate 405. Totem Lake Park is generally bordered by residential developments to the north and commercial developments to the west, south, and east. Interstate 405 lies approximately 0.2 miles to the west and the Cross Kirkland Corridor Trail (CKC Trail) extends along the southeastern perimeter of the Park. The majority of the proposed park developments will occur on one City-owned parcel (King County Tax Parcel 6928400032) and one parcel owned by the King Conservation District (King County Tax Parcel 8663270060). Some limited trail improvements will require a temporary easement on two privately owned parcels to the north (King County Tax Parcels 8663270010 and 1542000000). The entire project area is within the Lake Washington Watershed in Water Resource Inventory Area (WRIA) 8. Several wetlands and streams are mapped as occurring with the project area (Figure 2) and are detailed in Section 5.1.

3.0 PROJECT DESCRIPTION

The City is proposing improvements to Totem Lake Park under a Master Plan. The overall plan aims to integrate the natural setting of Totem Lake with the surrounding urban area. Master Plan elements applicable to Totem Lake Park include but are not limited to: implementation of a trail/boardwalk to form a loop with existing pathways, improved pedestrian and bicyclists connections to the surrounding commercial and residential properties, a new restroom building, limited ADA parking, play area, pedestrian seating and picnic areas, opportunities for public art, and enhancement of the storm drainage and ecological functions of the wetland and surrounding area. There will also be frontage improvements associated with development of the site. The City will implement additional elements from the Master Plan over time as funding becomes available.
This project is Phase 1 of the Master Plan and would construct an approximately 720 linear-foot boardwalk on the eastern and northern portion of the property. The boardwalk will provide a connection between the CKC Trail and the existing foot path on the north side of the park. The majority of the proposed boardwalk had been designed to be outside of the floodplain, except where necessary to connect to the asphalt path (Figure 3). The proposed boardwalk will have a width of 10 feet and decking will consist of open grating that will allow approximately 25% light penetration. A 43-inch high cable railing will be installed on both sides of the boardwalk. Each railing has an approximate width of 1.5 inches resulting in the boardwalk having a total width of 10.3 feet.

The boardwalk height above the water level will vary throughout the alignment averaging 8 feet above the water surface with the lowest elevations occurring at the boardwalk termini, where the trail transitions to pavement. Estimated elevation over the lake water level is 1.3 feet at the northern extent of the trail and 5.2 feet at the southern extent. Moving waterward over the lake from these transition areas, the boardwalk gently slopes upward reaching a maximum height of 9.2 feet above the water level. Footings for portions of the boardwalk within the wetland will be 2-inch diameter steel pipe pilings. No mechanized clearing, disturbance, or excavation of wetland soils will occur. Construction of the boardwalk will occur in a sequenced manner moving waterward from the shoreline by using built portions as construction access. No construction equipment will enter the wetland or wetted portions of the lake over the entirety of construction. The total area of boardwalk is approximately 5,592 square feet, all of which is located above the OHWM of Totem Lake. The boardwalk will be constructed with open grating to minimize impacts to wetland functions. Removal of existing vegetation will be minimized to the extent possible and all cleared trees will remain in the wetland or wetland buffer to be used as habitat logs.

Other project improvements under Phase 1 include the creation of a play area on the north side of the park (in the former 1.2-acre Yuppie Pawn space). In order to accommodate the play area and an associated new restroom, the vacant Yuppie Pawn building will be demolished. The proposed play area will be approximately 31,300 square feet and will include play features such as play structures/equipment and a turf field. The remainder of the site will be planted with native vegetation. There will be a 28,332 square foot (SF) (0.65-acre) net decrease in impervious surface at the park site. Additionally, all remaining impervious surface at the park will be non-pollution generating.

Stormwater improvements will also be installed to collect and discharge all stormwater onsite through the construction of bioretention stormwater facilities within the former Yuppie Pawn space. Proposed stormwater improvements at the play area will treat stormwater runoff in bioretention cells which will reduce the peak flow and duration to the wetland as well as improve the water quality of the runoff to the wetland.

Improvements to the existing asphalt path (Totem Lake Path) on the north side of the lake will also occur under Phase 1. The path will be widened to 10-feet within its current alignment and resurfaced to meet standards for accessible design (i.e., ADA standards). In addition to the widening of the path, the area will be graded and a retaining wall will be installed the length of the path. The wall will be backfilled with rocks to facilitate drainage. The widening of the existing path and installation of retaining walls and backfill will result in a net increase of 7,608 SF (0.17) of impervious surface, the majority of which is in the floodplain, and all non-pollution generating.
Table 1-1 is a summary of elements associated with the Phase 1 park improvements. 100% design of these features are detailed in Figures 4a through 4e.

**TABLE 1**

</table>
| Boardwalk connection between CKC Trail and existing asphalt | Length: 720 linear feet  
Width: 10 feet  
Area: 5,592 square feet  
Decking: Open grate  
Handrail: Yes; metal panel railing at 43 inches height  
Foundation: 2” Steel pipe pilings |
| Widening of existing asphalt path                    | Width 10 feet  
ADA access: Yes  
Change in Impervious Surface: +7,608 SF |
| Play area and restroom                               | Area: 31,300 square feet  
Elements: play structures, synthetic turf area, grass lawn area, native plantings  
Change in Impervious Surface: -28,332 SF |

**4.0 ACTION AREA**

FEMA defines the Action Area as all areas, within the Special Flood Hazard Area (SFHA), that could be impacted by the proposal, including indirect effects and effects of interrelated and interdependent actions (FEMA, 2017). The Action Area for this habitat assessment is the entire Totem Lake 100-year floodplain (Figure 2 and 3). The majority of the Action Area is within the boundary of Wetland A, with the exception of portions in the northern and northwestern extent of the floodplain, which are currently developed with commercial and residential uses. Some forested areas also occur within these areas and are dominated by a mixture of deciduous and coniferous trees. No streams are mapped as occurring within the Action Area.

**5.0 HABITAT DESCRIPTION**

**5.1 Background Information**

The National Wetland Inventory (NWI) identifies a large wetland within Totem Lake Park (the Totem Lake Wetland). NWI maps this wetland as containing emergent, scrub-shrub, forested, and open water elements. Totem Lake is the open water element of the larger wetland at the site. Additionally, three small wetlands are mapped in the project vicinity; one on the southwest side of Totem Lake Blvd NE and two on the southeast side of the CKC Trail (Figure 2). These three smaller wetlands are outside of the Phase 1 project area. Other large wetland complexes are mapped approximately 0.3 miles to the west within the Juanita Creek basin.
In addition to the Totem Lake Wetland, the City of Kirkland Sensitive Areas map (2018) shows one stream exiting Totem Lake near the southwest corner, and eventually flowing into Juanita Creek. The majority of this stream is piped from the outlet at Totem Lake to the western side of Interstate 405. An additional stream is mapped as being piped into the wetland from a small wetland feature and ditch on the southern side of the CKC Trail (Figure 2).

The State of Washington Department of Ecology (Ecology) maps an additional unnamed stream flowing into Totem Lake from the east along the northwest side of the CKC Trail (Figure 2). This stream is on Ecology’s 303(d) list for dissolved oxygen. Several stormwater outfalls are also mapped by Ecology as being located with Totem Lake. No stream typing is provided by the City or Ecology for these streams.

5.2 Protected Species Identification

Both NMFS and USFWS provide listings of threatened and endangered species under their jurisdiction. The proposed project occurs within the general range of several ESA listed species. The current listings from NMFS indicates the potential presence of two federally-listed salmon species within the project vicinity, including the Puget Sound Evolutionary Significant Unit (ESU) of Chinook salmon (*Oncorhynchus tshawytscha*), as well as with one species under the jurisdiction of the USFWS, the Puget Sound Distinct Population Segment (DPS) of steelhead (*O. mykiss*) (Table 2).

*Threatened: Species are likely to become endangered within the foreseeable future.*

The USFWS, through the IPaC website, provides a site-specific species list for the project area (Table 2 and Attachment 1). In addition to bull trout, the IPaC report includes four threatened wildlife species; marbled murrelet (*Brachyramphus marmoratus*), streaked horned lark (*Eremophila alpestris strigata*) and yellow-billed cuckoo (*Coccyzus americanus*), as well as a proposed threatened species North American wolverine (*Gulo gulo luscus*). With the unlikely exception of bull trout, the other species identified in the IPaC report, were either not historically distributed within the Action Area or the Action Area does not
contain suitable habitat features to support the species. The project will have no effect on these species, for the reasons described in the following paragraphs.

Nesting habitat for marbled murrelet consist of large coniferous older forest stands. Suitable habitat, defined by USFWS (2012) as conifer-dominated stands greater than 5 acres with trees > 15-inch-diameter at breast height (dbh), that contain nesting platforms (meeting criteria of minimum of 4 inches wide and minimum of 33 feet above the ground), is not present within the Action Area. Although marbled murrelets may use the marine waters of Puget Sound for foraging, the Sound is located over 0.5 miles away from the project site and is not within line of site.

A key attribute of streaked horned lark habitat is open (i.e., flat, treeless) landscapes of 300 acres or more, such as the type of habitat present within airports (USFWS, 2013). Such habitat is entirely lacking within the Action Area.

Yellow-billed cuckoos are extremely rare in Washington State and if breeding still occurs in the state, it is likely limited to an extremely small number of breeding pairs (single digits). Furthermore, yellow billed cuckoo breed in large blocks of riparian habitats (particularly woodlands containing cottonwoods and willows) (Erhlich et al., 1988). Such habitat is entirely lacking within the Action Area.

The North American wolverine is found in remote, dense, and mature forests free from human activity (e.g., Cascade Mountains), not highly urbanized sites such as the Action Area.

In summary, marbled murrelet, streaked horned lark, yellow-billed cuckoo, and North American wolverine are not likely to occur on the site due to a lack of suitable habitat for these species. Therefore, these species or their designated critical habitats (where applicable) will not be affected by the project and these species are not addressed further in this BA.

Listed fish species in the project vicinity were determined through a review of species information provided by NMFS (Attachment 2), and on habitat information provided by Washington Department of Fish and Wildlife (WDFW 2019a; WDFW 2019b).

Chinook salmon, steelhead, and bull trout may all occur in the marine waters of Puget Sound in various life history forms throughout the year; however, use of Totem Lake by these species has not been documented (WDFW 2019a; WDFW 2019b). The nearest stream that provides habitat for ESA-listed salmonids is a reach of Juanita Creek, approximately 1.4 miles downstream. There is no designated critical habitat for any ESA-listed fish species within the Action Area. The closest designated critical habitat for Puget Sound Chinook salmon (NMFS, 2005) and Coastal-Puget Sound bull trout (USFWS, 2010) is in Lake Washington, over two miles downstream of the Action Area, while the closest designated critical habitat for Puget Sound steelhead is in the mainstem Cedar River, over 15 miles away from the Action Area.

No aquatic or terrestrial ESA listed species are documented as using the Action Area. Furthermore, no critical habitat mapped within the Action Area for any ESA listed species.
5.3 Site Visit

5.3.1 Wetlands

Field investigations were conducted by biologists Ilon Logan and Jessica Redman on January 5, 2016, and Jessica Redman and Christina Hersum on June 19, 2017. Field efforts were focused on areas of the park where improvements are proposed and did not include the southern corner of the wetland or the southeast side of the CKC Trail where the previously mentioned stream is located. One wetland (Wetland A) was delineated during these field efforts. According to FEMA floodplain mapping, the majority of the park and asphalt path improvements occur within the 100-year floodplain, as well as the northern extents of the proposed boardwalk (Figure 3).

Wetland A is located in the majority of the Action Area and is a depressional palustrine scrub-shrub and palustrine emergent (PSS/PEM) wetland, approximately 18 acres in size. Totem Lake, an open water feature in the center of Wetland A, is approximately 3 acres and supports a narrow aquatic bed fringe around its edge. The majority of Wetland A is a mixture of PSS and PEM plant communities. PSS communities are dominated by willow, red-osier dogwood, and Douglas spirea. PEM communities in the wetland are dominated by common cattail with slough sedge and skunk cabbage present to a lesser extent. A narrow forested area on the northern edge of the wetland is dominated by red alder with an understory of restoration plantings including Sitka spruce and western redcedar. Aquatic bed vegetation in the lake includes pond weed and yellow pond lily. Outside of the emergent and scrub-shrub vegetation, additional habitat features (Standing snags, downed wood, etc.) are limited.

Sources of hydrology to Wetland A include a high groundwater table, precipitation, multiple stormwater inputs, and the seasonal stream on the southeast side of the CKC Trail. The outlet of the Wetland A is a partially blocked culvert on its west side, east of 120th Avenue NE and Totem Lake Boulevard NE.

5.3.2 Streams

During the January 2016 site visit, no connection between Wetland A and the mapped stream to the southeast of the site was observed, and according to a previous study, this stream instead flows southwesterly into a ditch for some length before it is presumably piped again (Watershed Company, 2013). The downstream portion of the ditch is largely dominated by Himalayan blackberry and no suitable salmonid habitat was observed in the ditch.

Although a stream is mapped in the western portion of the site, no defined stream channel was observed during reconnaissance of this area. In this area, at the outlet of Wetland A, a partially blocked culvert east of 120th Avenue NE and Totem Lake Boulevard NE was observed. During the January 2018 site visit, the area was characterized by standing water several feet deep, choked with cattails and refuse, which does not represent suitable salmonid habitat.

Additionally, no defined stream channel was observed entering Totem Lake from the east as mapped by Ecology. According to City mapping, this stream instead originates along the hillside to the northwest, and flows north to south before entering a ditch along the north side of the CKC, and eventually flows into the Sammamish River. Based on site observations, the ditch does not contain suitable salmonid habitat.
5.3.3 Uplands

Within the Action Area, the north side of the wetland has a narrow upland fringe consisting of native deciduous and native coniferous trees. Conditions of the remainder of the SFHA within upland areas of the Action Area are largely developed and degraded. Adjacent to this narrow, forested area is a paved pedestrian path and multi-story residential developments. Himalayan blackberry is present along several portions of the asphalt path. Additional existing developments within the Action Area include existing boardwalks and the southwestern portion of the former Yuppie Pawn site, which is currently dominated by non-native landscaped trees, a paved parking lot, and a derelict building. The outfall at Totem Lake Boulevard is also the confluence of runoff from these developed areas. The western and southwestern edges of the wetland extend adjacent to the hardscape leaving little buffer between the wetland and a retaining wall at the former Yuppie Pawn site. The majority of the upland portion of the Action Area is already developed and provides little habitat for terrestrial species or a corridor connection to the wetland, and as mentioned above, does not represent suitable habitat for the ESA listed terrestrial species mentioned above.

6.0 HABITAT NARRATIVE

According to the FEMA floodplain habitat assessment guidance (FEMA 2013) the habitat narrative must include an analysis of several habitat elements that address the habitat factors required by the BiOp to assist jurisdictions in considering impacts to aquatic impacts and ESA listed fish species as a result of the project. A brief discussion of each habitat variable and its presence in the Action Area is below.

6.1 Primary Constituent Elements (PCEs)

Primary Constituent Elements (PCEs) are specific elements of physical or biological features that provide for a species’ life-history processes and are essential to the conservation of the species and used to define the presence or absence of critical habitat. Within freshwater sites, examples of these include freshwater spawning sites, freshwater rearing sites, and freshwater migration corridors. None of these sites occur within the Action Area, and the nearest stream the provides habitat for ESA-listed salmonids is in Juanita Creek, approximately 1.4 miles downstream. No defined stream channels were observed within the Action Area during the site visits. Additionally, waters upstream and downstream of the Action Area are largely piped and likely would not provide for migration corridors. Furthermore, aquatic portions of the Action Area are primarily shallow waters dominated by mucky soils that would likely not provide rearing or spawning habitat. It is anticipated that the project will have no effect of PCE’s for ESA-listed salmonids as no critical habitat is within the Action Area.

6.2 Water Quality and Quantity

An unnamed stream is mapped by Ecology flowing into Totem Lake from the east and is on Ecology’s 303(d) list for dissolved oxygen (Ecology, 2019). As mentioned above, a stream channel was not observed here during the site visit. However, several stormwater outfalls are also mapped by Ecology in this location, indicating the mapped feature is likely a culvert input. The ditched portion of this feature, approximately 1,000 feet upstream of the wetland, is on Ecology’s 303(d) list for dissolved oxygen and
bacteria. Though higher levels of dissolved oxygen are often synonymous with higher water temperatures, temperatures recorded in Totem Lake have likely not exceeded water quality criteria frequently enough to be placed on Ecology’s 303(d) list. The water quality standard for temperature in Totem Lake is 16°C (highest 7-day average of the daily maximum temperature).

Surface water runoff from the developed portion of the Action Area generally drains from north to south and is collected in an existing storm drain catch basin near the southwest corner of the former Yuppie Pawn site. The existing catch basin connects to an existing 24-inch storm drain, which discharges to Totem Lake. Runoff from the existing trail sheet flows down to Totem Lake, and rainfall over the proposed boardwalk area falls directly onto the water and/or wetland areas. Surface runoff from Totem Lake Way, adjacent to a commercial site, drains to a separate storm system that also outfalls to Totem Lake via a separate outlet west of the existing catch basin. In 2014, the City resolved local flooding issues by replacing three segments of existing culverts, including the outlet of the lake. The culvert improvements have addressed previously reported drainage issues at the time of the project. According to the City, the ordinary high-water mark indicated on the plans is well below the indicated adjacent roadway elevations (CH2M, 2018).

No flow levels were recorded as a part of this assessment, however, the aquatic portion of the Action Area is inundated throughout the year. Inundation was observed in both the summer and winter site visits. It is likely that water levels are slightly lower during summer months and during drought conditions, but these minor changes in water elevation are likely negligible on the overall system.

According to a geotechnical investigation performed by AESI (2017), groundwater was found in multiple exploration borings between 8 and 18 feet below the ground surface, with perched groundwater conditions present above wetland/peat deposits. The level and occurrence of groundwater seepage is expected to change due to factors including changes in season, precipitation, and site use.

Development within a floodplain that involves the addition of impervious surfaces can degrade water quality and negatively affect the flow regime of the adjacent waterbody. However, park improvements are reducing the reducing net impervious surface in the park by 20,724 SF (0.48 acre) while providing some additional floodplain storage not present today. Improvements along the existing asphalt path will result in a slight increase of impervious surface. However, all new impervious surfaces will be non-pollution generating and most of the new trail will overlay existing asphalt path.

Ground disturbance and other activities during construction have potential to result in short-term impacts to water quality within the adjacent wetland area. However, with the implementation of temporary erosion and sediment control (TESC) plan and other construction related best management practices, the proposed action is anticipated to result in no effects to habitat with respect to water quality and quantity.

### 6.3 Stream Substrate

No stream channels were observed in the Action Area. Aquatic portions of the Action Area are primarily shallow waters dominated by mucky soils that would likely not provide rearing or spawning habitat. However, the proposed project is not anticipated to cause increased rates of aggradation of fine or coarse sediments that would affect those habitats, if present. The proposed action involves limited in-water work.
Footings for portions of the boardwalk within the wetland will be 2-inch diameter steel pipe pilings. Installation of these features will not alter substrate size or distribution. No mechanized clearing, disturbance of wetland soils, or excavation will occur. Construction of the boardwalk will occur in a sequenced manner using built portions as construction access; all construction equipment will be kept above water levels during the entirety of construction. Additionally, the implementation of the TESC plan and BMPs will further ensure that the project has no effect on stream/lake substrates.

6.4 Floodplain Connectivity

The mapped floodplain of Totem Lake is isolated and does not contain a connection to any streams, side-channels, or tributaries. The proposed park improvements would not change or have an effect on the existing floodplain connectivity and therefore, would not result in habitat isolation.

6.5 Refugia for ESA-listed Species from High Velocity Flows

No ESA-listed species are present within the Action Area. Additionally, there is no floodplain refugia within the Action Area and therefore, the project will have no effect on the location, extent, or quality of habitat available to ESA-listed fish species from high velocity flows.

6.6 Riparian Vegetative Community

No stream channels are present within the Action Area. The aquatic portion of the Action Area is primarily the open water portion of Totem Lake and Wetland A, which is dominated by a scrub-shrub vegetative community. Some larger trees occur along the existing asphalt path but these would provide little opportunity for large woody debris (LWD) recruitment. Additionally, no stream channels occur within the Action Area where LWD recruitment would be beneficial for the creation of fish habitat. Furthermore, the majority of the proposed tree removal occurs at the former Yuppie Pawn site and will have little effect on the aquatic portion of the Action Area. Trees that are removed will be left onsite in the wetland and wetland buffer to provide a functional lift for the habitat of Wetland A.

7.0 CONSTRUCTION PROCESS

The project is scheduled to start the first quarter of 2019 and be completed by the fourth quarter of 2019. Construction is estimated to be approximately nine months and will adhere to all permit conditions.

7.1 Boardwalk Construction

The only in-water work proposed by the project will be the construction of the boardwalk, the majority of which will be constructed outside of the Action Area. As mentioned above, footings for portions of the boardwalk within the wetland will be 2-inch diameter steel pipe pilings. No mechanized clearing, disturbance of wetland soils, or excavation will occur. Construction of the boardwalk will occur in a sequenced manner using built portions as construction access; all construction equipment will be kept above
water levels during the entirety of construction. The boardwalk will be constructed with open grating to minimize impacts to wetland functions. Removal of existing vegetation will be minimized to the extent possible and all cleared trees will remain in the wetland or wetland buffer to be used as habitat logs.

7.2 Play Area Construction

Within the former Yuppie Pawn site, the entire site within the limits of work will be cleared of existing vegetation, hardscape, and structures, with the exception of trees located along the southern, wetland edge of the site. The vegetation removal consists primarily of non-native ornamental planting areas. The majority of the site clearing work is for pavement and structure clearing. Approximately 1,300 cubic yards (CY) of material will be placed as fill and approximately 1,900 CY of material will be cut from existing areas; the balance of cut and fill is approximately 600 CY cut material. Over 90% of the site will be graded to some degree.

No wastewater will be treated on site; however, the site will feature stormwater treatments. Methods used to install utilities include open trenching for below grade utilities, and placement of utilities, such as transformers, on concrete pads on grade.

Two primary methods of construction will be used for the construction of play structures. All structures sensitive to settlement, including a built-in-place Restroom Building, Play Structures, and Site Stairs, will be built on place on below grade driven steel pile system. All other structures, mostly limited to paving, but also include some site walls, fences, and lighting, will be constructed on a prepared subgrade using traditional construction techniques. No shoreline modification is proposed. Equipment used for site construction includes: pile driving equipment, excavators, concrete trucks, dump trucks, bulldozers, small grading machines such as bobcats, and ordinary powered handheld tools.

Mobilization and staging plans will be developed by the contractor onsite. Occasional use of Totem Lake Way Right-of-Way and the Cross Kirkland Corridor shared use path will be necessary to construction activities. Construction will obstruct vehicles currently exiting the adjacent property to the west which currently use a driveway on the park site off their property. Therefore, a temporary driveway will be provided on the private property to maintain vehicular exiting throughout construction.

7.3 Trail Construction

An area defined by project limit line to the North, a 2- to 6-foot offset from the proposed trail edge to the South, and the West and East ends of the trail will be completely cleared of all vegetation with the exception of an area north of the trail at the east end. Vegetation occurring within all other areas of the trail site within the limit of work will be preserved except for removal of hazard trees. Hazard tree removal will be mitigated on site with new tree plantings, planted with the existing planting at a ratio of 2 new trees for every 1 tree removed.

The entire cleared area will be graded to some degree. The asphalt trail is a widening of an existing trail. In order to widen the existing trail, the new trail will be cut into the existing slope on the north and south sides of the path at varying locations. The cut slopes will be retained by a rockery retaining wall. No fill
soil will be placed. However, the cut slopes are laid back beyond the slope of the rockery wall. The space between the rockery wall and the cut slope will be filled with imported 2 – to 4-inch quarry spall rock material. No wastewater will be treated on site. The only utilities occurring on the trail site are wall underdrain pipes which outlet into the landscape on the South edge of the trail.

All The trail and fencing will be constructed on a prepared subgrade using traditional construction techniques. No shoreline modification is proposed. Equipment used for site construction includes: small scale excavators, small grading machines such as bobcats, and ordinary powered handheld tools.

The Contractor is expected to mobilize and stage on the play area site immediately to the west of the trail site. The trail site may be used for construction access to the Boardwalk site. Similar to park construction, occasional use of Totem Lake Way Right-of-Way will be necessary for construction activities.

7.4 Protection Measures and Best Management Practices

To avoid erosion and the transport of sediment off site, the contractor will implement temporary control measures during the project’s construction phase. During construction, stormwater runoff will be conveyed in the existing conveyance systems, which are primarily storm drains. Erosion and sediment control (ESC) measures will be needed to prevent runoff from causing erosion and discharging sediment into the existing drainage system during and after construction. Appropriate ESC measures will be needed for construction activities on existing storm drain systems. The contractor will be responsible for phasing ESC measures so that they are coordinated with staging construction activities. Additionally, the contractor will be responsible for inspecting and maintaining temporary controls during construction, including removing accumulated sediment, and for removing the controls and remaining accumulated sediment at the end of construction.

The following ESC measures will be provided:

**Clearing limits** – Clearing limits will be delineated on the construction plans. A silt fence and compost socks will be installed down slope of any fill slopes to prevent offsite sediment migration.

**Cover measures** – The contractor will provide temporary and permanent cover measures where needed to protect disturbed areas. Mulching will be used in accordance with the King County Surface Water Design Manual (KCSWDM) Appendix D to provide immediate, temporary protection from erosion and to enhance plant growth. Nets and blankets may be used according to KCSWDM Appendix D to provide additional protection and to hold seed and mulch in place on slopes (King County, 2016). Disturbed areas will be seeded as a permanent cover measure to reduce erosion.

**Perimeter protection** – To reduce the transport of sediment off site, the contractor will provide catch basin filters, site fence, and street sweeping as indicated on the final construction drawings and as needed.

**Traffic area stabilization** – Stabilized construction entrances will be installed at all construction vehicle access locations.
**Sediment retention** – Catch basin filters (inlet protection) will provide sediment retention at the locations shown on the final construction drawings.

**Surface water collection** – Surface water control will be provided by using the existing and new drainage conveyance systems. The surrounding area will be protected with silt fences.

**Dewatering control** – Groundwater is not expected to be encountered during construction. If groundwater is encountered during construction, then it may be pumped to an onsite sediment trap or to a catchment created by sandbags with an overflow into a catch basin containing a catch basin insert.

**Dust control** – If necessary, the contractor will use water according to KCSWDM Section 3.8 to prevent wind transport of soil. Exposed soils will be sprayed until wet and resprayed as needed. When using water for dust control, the contractor will spray exposed soils until they are wet, but runoff should not be generated by spraying. Oil will not be used for dust control. At the contractor’s option, a tackifier may be used with approval from the Engineer and the City of Kirkland.

**Flow control** – Portable storage tanks are proposed during construction at the southwest portion of the site and will provide sediment retention and possible flow control as needed. Construction activities will remove and permanently reduce the amount of impervious surface area on the site. Excessive runoff during construction is not anticipated, because the site will be mostly pervious.

**ESC implementation** – Site development activities relative to ESC concerns will be coordinated and appropriately timed, and protective measures will be inspected, maintained, and updated in a timely fashion. The project will be phased to consider seasonal work limits to the maximum degree practicable. BMPs will be inspected, monitored, and repaired as needed. The site will be inspected and monitored, and the contractor will maintain, update, and implement the Construction Stormwater Pollution Prevention Plan (CSWPPP) in accordance with the Construction Stormwater General Permit and King County requirements. The contractor also will designate a certified ESC lead and provide give his or her name, address, and telephone number to the City of Kirkland before construction begins. The certified ESC lead will be present on site or on-call at all times.

The certified ESC lead will inspect the site at least once a month during the dry season, weekly during the wet season, and within 24 hours of each runoff-producing storm.

## 8.0 EFFECTS ANALYSIS

### 8.1 Direct Effects

Park improvements will result in a net decrease of 20,724 SF (0.48 acre) of impervious surfaces, primarily at the play area. All new impervious surfaces due to the widening of the asphalt path will be non-pollution generating and mostly overlay the existing asphalt path. Stormwater improvements will also be installed to collect and discharge all stormwater onsite through the construction of bioretention stormwater facilities within the former Yuppie Pawn space. Proposed stormwater improvements at the play area will treat stormwater runoff in bioretention cells which will reduce the peak flow and duration to the wetland as well as improve the water quality of the runoff to the wetland. No streams occur within
the Action Area. Additionally, there are no habitats used by ESA-listed species within the Action Area, and therefore, the project will result in *no direct effects* to listed species or their habitats.

### 8.2 Indirect Effects

The project will result in *no indirect effects* to ESA-listed species. No habitats used by ESA-listed species occur within the Action Area and no potential for suitable habitat formation is anticipated due to the level of development in the vicinity of the project. Proposed improvements do not include activities such as bank armoring or channel straightening that could potentially impact areas downstream of the Action Area. Additionally, no effects to the variables discussed above are anticipated within the project site and therefore, it is anticipated that areas downstream of the Action Area will also not be effected. The project will not result in any changes to development patterns or rates.

### 8.3 Interrelated and Interdependent Actions

No interrelated or interdependent actions will occur that would negatively impact ESA-listed species as a result of the project. Development during other phases of the Totem Lake Master Plan may be considered interrelated actions. However, these additional phases of the Totem Lake Master Plan will likely undergo independent effects analyses to determine possible effects on ESA-listed species and no effects are anticipated due to the lack of habitat. Additionally, there is no other action or project that will have an independent use or effect as a result of the proposed action and therefore, the proposed action will have no interdependent effects.

### 8.4 Cumulative Effects

The project, in conjunction with other current actions or reasonably foreseeable future actions, would not impact ESA-listed species. The site does not support ESA-listed species, and due to the level of development in the vicinity of the project, no potential for suitable habitat formation is anticipated in the foreseeable future.

Subject: List of threatened and endangered species that may occur in your proposed project location, and/or may be affected by your proposed project

To Whom It May Concern:

The enclosed species list identifies threatened, endangered, and proposed species, designated and proposed critical habitat, and candidate species that may occur within the boundary of your proposed project and/or may be affected by your proposed project. The species list fulfills the requirements of the U.S. Fish and Wildlife Service (Service) under section 7(c) of the Endangered Species Act (Act) of 1973, as amended (16 U.S.C. 1531 et seq.).

New information based on updated surveys, changes in the abundance and distribution of species, changed habitat conditions, or other factors could change this list. The species list is currently compiled at the county level. Additional information is available from the Washington Department of Fish and Wildlife, Priority Habitats and Species website: http://wdfw.wa.gov/mapping/phs/ or at our office website: http://www.fws.gov/wafwo/species_new.html. Please note that under 50 CFR 402.12(e) of the regulations implementing section 7 of the Act, the accuracy of this species list should be verified after 90 days. This verification can be completed formally or informally as desired. The Service recommends that verification be completed by visiting the ECOS-IPaC website at regular intervals during project planning and implementation for updates to species lists and information. An updated list may be requested through the ECOS-IPaC system by completing the same process used to receive the enclosed list.

The purpose of the Act is to provide a means whereby threatened and endangered species and the ecosystems upon which they depend may be conserved. Under sections 7(a)(1) and 7(a)(2) of the Act and its implementing regulations (50 CFR 402 et seq.), Federal agencies are required to utilize their authorities to carry out programs for the conservation of threatened and endangered species and to determine whether projects may affect threatened and endangered species and/or designated critical habitat.
A Biological Assessment is required for construction projects (or other undertakings having similar physical impacts) that are major Federal actions significantly affecting the quality of the human environment as defined in the National Environmental Policy Act (42 U.S.C. 4332(2) (c)). For projects other than major construction activities, the Service suggests that a biological evaluation similar to a Biological Assessment be prepared to determine whether or not the project may affect listed or proposed species and/or designated or proposed critical habitat. Recommended contents of a Biological Assessment are described at 50 CFR 402.12.

If a Federal agency determines, based on the Biological Assessment or biological evaluation, that listed species and/or designated critical habitat may be affected by the proposed project, the agency is required to consult with the Service pursuant to 50 CFR 402. In addition, the Service recommends that candidate species, proposed species, and proposed critical habitat be addressed within the consultation. More information on the regulations and procedures for section 7 consultation, including the role of permit or license applicants, can be found in the "Endangered Species Consultation Handbook" at: http://www.fws.gov/endangered/esa-library/pdf/TOC-GLOS.PDF

Please be aware that bald and golden eagles are protected under the Bald and Golden Eagle Protection Act (16 U.S.C. 668 et seq.). You may visit our website at http://www.fws.gov/pacific/eagle/for information on disturbance or take of the species and information on how to get a permit and what current guidelines and regulations are. Some projects affecting these species may require development of an eagle conservation plan: (http://www.fws.gov/windenergy/eagle_guidance.html). Additionally, wind energy projects should follow the wind energy guidelines (http://www.fws.gov/windenergy/) for minimizing impacts to migratory birds and bats.

Also be aware that all marine mammals are protected under the Marine Mammal Protection Act (MMPA). The MMPA prohibits, with certain exceptions, the "take" of marine mammals in U.S. waters and by U.S. citizens on the high seas. The importation of marine mammals and marine mammal products into the U.S. is also prohibited. More information can be found on the MMPA website: http://www.nmfs.noaa.gov/pr/laws/mmpa/.

We appreciate your concern for threatened and endangered species. The Service encourages Federal agencies to include conservation of threatened and endangered species into their project planning to further the purposes of the Act. Please include the Consultation Tracking Number in the header of this letter with any request for consultation or correspondence about your project that you submit to our office.

Event Code: 01EWFW00-2019-E-00736
Project Name: Totem Lake Park Development -- Phase 1
Project Type: TRANSPORTATION
Project Description: Construction of a boardwalk, path, and play field at Totem Lake Park

Project Location:
Approximate location of the project can be viewed in Google Maps: https://www.google.com/maps/place/47.71125589983922N122.17590280729542W

Counties: King, WA
Endangered Species Act Species

There is a total of 5 threatened, endangered, or candidate species on this species list.

Species on this list should be considered in an effects analysis for your project and could include species that exist in another geographic area. For example, certain fish may appear on the species list because a project could affect downstream species.

IPaC does not display listed species or critical habitats under the sole jurisdiction of NOAA Fisheries, as USFWS does not have the authority to speak on behalf of NOAA and the Department of Commerce.

See the "Critical habitats" section below for those critical habitats that lie wholly or partially within your project area under this office's jurisdiction. Please contact the designated FWS office if you have questions.

1. NOAA Fisheries, also known as the National Marine Fisheries Service (NMFS), is an office of the National Oceanic and Atmospheric Administration within the Department of Commerce.

kirkland, WA

Project #: GFJ

Design: GFJ

Sheet: 5
Lateral Analysis (Boardwalk)

$S_s = 1.254$, $F_t = 0.90$, $S_{sm} = 1.128$, $S_{ds} = 0.752$

$S_1 = 0.483$, $F_V = 2.40$, $S_{my} = 1.159$, $S_{d1} = 0.773$

Site Class "E", Risk Category II

$R = 1.25$ (Ordinary Cantilevered Steel Column System)

Allowed for Site Class "E", Footnote "i"

due to height + weight

$C_s = \frac{S_{ds}}{(R/\text{KS})} = \frac{0.752}{(1.25/100)} = 0.602$ + Governs

$C_{s\text{max}} = \frac{S_{d1}}{T(R/\text{KS})} = \frac{0.773}{10(1.25/100)} = 0.616$

$C_{s\text{min}} = 0.0449S_{ds}\text{ KS} = 0.033$

$V_{base} = C_s \cdot W$

$C_s = 0.602$

$W = (20 \text{ psf} \times 16' \times 20') = 4000 \text{ lbs}$

$V_{base} = 0.602 \times 4000 = 2.411 \text{ k}$

$V_{base(ASD)} = (0.7)(2.411) = 1.681 \text{ k} (\text{East Direction})$

Projected Sail Area (Perp. To Boardwalk)

$T = (20')(4.5)(0.65)(16 \text{ psf}) = 936 \text{ lbs}$ (Service Level)

$V_{base} = 0.6(936 \text{ lbs}) = 562 \text{ lbs}$ (ASD) (Perp.)

Seismic Governs

Totem Lake Park 12/1/18

PROJECT Kirkland, WA

DATE

PROJ.  G-F-J

DESIGN L-1

SHEET
Lateral Design (Boardwalk)

\[ V_{\text{base}} = 1.68 \text{kN (ASD)} \] Ea Pile Cap.

* Use Battered Piles to Resist Forces *

Use Horiz component of Battered Piles 2°:

\[ = \left( \sin(14°) \right) \left( 4,000 \text{ lbs} \right) = 0.967 \text{ kN/pile} \]

Use (2) 2"/\# Battered Piles In Ea Direction

\[ L_p = (2)(0.967 \text{ kN/pile}) = 1.93 \text{ kN} > 1.68 \text{ kN} \] OK

Totem Lake, Kirkland, WA

12/1/18

PROJECT

DESIGN

SHEET
Lateral Design (Boardwalk Beam)

Design Theory:
Since the grating used does not have the ability to act as a structural diaphragm, we are checking the boardwalk beams for connections in weak-axis bending to transfer seismic forces.

Check Center Beam:

\[ \text{Span} = 20' \]
\[ w_1 = (1680 \text{ lbs}) \left( \frac{1}{2} \right) \left( \frac{1}{10} \right) = 84 \text{ p} \text{lbf} \]

Trib Area:

Weak Axis Bending (Seismic Only)

\[ R_a = 0.84 k \]
\[ V_{ax} / \alpha = 61.3 k \]
\[ V_a = 0.84 k \]
\[ M_{nx} / \alpha = 20.4 k \]
\[ M_a = 4.70 k \]
\[ \kappa = 0.60" / 398 \]

Use W12x26

Check Biaxial Flexure (Combined)

\[ P_r / P_c < 0.2 \]

\[ \text{Use } \frac{P_r}{2P_c} \left( \frac{M_{nx} + M_{ny}}{M_{ncx}} \right) \leq 1.0 \]

\[ \left( \frac{4.70}{20.4} + \frac{20.0}{75.7} \right) = 0.601 < 1.00 \]

Use W12x26

Totem Lake Park
Kirkland, WA

12/1/06

DATE
PROJ. #
DESIGN
SHEET
Lateral Design Continued (Boardwall Beams)

Check Edge Beam:

Span  = 20'

\[ W = \left(1680 \times \frac{1}{14}\right) \times \frac{1}{10'} = 42 \text{ kips} \]

Weak Axis Bending

\[ \begin{align*}
Ra &= 0.42k' & Wn/\omega &= 27.4k \\
Va &= 0.42k' & Mn/\omega &= 9.53k \text{-kips} \\
Wc &= 2.10k' & \Delta &= 1.17(1/20s)
\end{align*} \]

Use C12x25

Check Biaxial Flexure (Combined)

\[ Pr/Pc < 0.2 \quad \text{Use Eqn} \quad \frac{Pr}{2Pc} \left( \frac{\text{Max}}{\text{Max}} + \frac{\text{Min}}{\text{Min}} \right) = 1.00 \]

\[ \left( \frac{2.10 + 15.00}{9.53 + 37.8} \right) = 0.162 < 1.00 \quad \text{OK} \]

Use C12x25

Check Connection @ Beam Ends:

Use (1) 5/8" x 307 Bolt To Pile Cap Beam

\[ \frac{Pr}{2} = 4.14k/\text{Bolt} > 840 \text{lbs or 420 lbs} \quad \text{OK} \]

Steel Beam

Lic. # : KW-06010241
Description : Roof Beam

CODE REFERENCES
Calculations per AISC 360-10, IBC 2012, ASCE 7-10
Load Combination Set : ASCE 7-10

Material Properties
Analysis Method : Allowable Strength Design
Beam Bracing : Beam is Fully Braced against lateral-torsional buckling
Bending Axis : Major Axis Bending
Load Combination ASCE 7-10

- 2015

Fy : Steel Yield : 50.0 ksi
E : Modulus : 29,000.0 ksi

NOTE = W10 x 14, 12

Applied Loads
Beam self weight calculated and added to loading
Uniform Load : D = 0.0160, S = 0.0250 ksi, Tributary Width = 4.0 ft, (Gravity)

DESIGN SUMMARY
Maximum Bending Stress Ratio = 0.282 : 1
Section used for this span W10x12
Ma : Applied 8.803 k-ft
Mn / Omega : Allowable 31.207 k-ft
Load Combination +D+S+H
Location of maximum on span 10,000 ft
Span # where maximum occurs Span # 1

Maximum Deflection
Max Downward Transient Deflection 0.233 in Ratio = 1,031
Max Upward Transient Deflection 0.000 in Ratio = 0 <360
Max Downward Total Deflection 0.409 in Ratio = 586
Max Upward Total Deflection 0.000 in Ratio = 0 <240

Design OK

Steel Beam

Lic. #: KW-06010241

Description: Roof Edge Channel Beam

CODE REFERENCES

Calculations per AISC 360-10, IBC 2012, ASCE 7-10
Load Combination Set: ASCE 7-10

IBC 2015 CV

Material Properties

Analysis Method: Allowable Strength Design
Beam Bracing: Beam is Fully Braced against lateral-torsional buckling
Bending Axis: Major Axis Bending
Load Combination: ASCE 7-10

$F_y : 36.0 \text{ ksi}$
$F : 29,000.0 \text{ ksi}$

Applied Loads

Beam self weight calculated and added to loading
Uniform Load: $D = 0.0160$, $S = 0.0250 \text{ ksf}$, Tributary Width = 2.0 ft, (Gravity)

Design Summary

Maximum Bending Stress Ratio = 0.235 : 1
Section used for this span: C12x20.7
$M_a : 10.796 \text{ k-ft}$
$M_n : 45.988 \text{ k-ft}$
Load Combination: $+D+S+H$
Location of maximum on span: 14.500 ft
Span # where maximum occurs: Span # 1

Maximum Deflection
Max Downward Transient Deflection: 0.214 in
Max Upward Transient Deflection: 0.003 in
Max Downward Total Deflection: 0.440 in
Max Upward Total Deflection: 0.000 in

Steel Beam

Lic. #: KW-06010241

Description: Roof Transfer Beam

CODE REFERENCES

Calculations per AISC 360-10, IBC 2012, ASCE 7-10
Load Combination Set: ASCE 7-10

IBC 2015 OK

Material Properties

Analysis Method: Allowable Strength Design
Beam Bracing: Beam is Fully Braced against lateral-torsional buckling
Bending Axis: Major Axis Bending
Load Combination ASCE 7-10

Applied Loads

Beam self weight calculated and added to loading
Load for Span Number 1
Uniform Load: D = 0.0160, S = 0.0250 ksf, Tributary Width = 4.0 ft, (Gravity)
Point Load: D = 1.870, S = 1.890 k @ 0.0 ft, (Side Beam)
Load for Span Number 2
Uniform Load: D = 0.0160, S = 0.0250 ksf, Tributary Width = 4.0 ft, (Gravity)
Load for Span Number 3
Uniform Load: D = 0.0160, S = 0.0250 ksf, Tributary Width = 4.0 ft, (Gravity)
Point Load: D = 1.870, S = 1.890 k @ 4.0 ft, (Side Beam)

DESIGN SUMMARY

Maximum Bending Stress Ratio = 0.379 : 1
Section used for this span W12x14
Ma Applied 16.465 k-ft
Mn / Omega : Allowable 43.413 k-ft
Load Combination +D+S+H
Location of maximum on span 4.000 ft
Span # where maximum occurs Span # 1
Maximum Deflection
Max Downward Transient Deflection 0.165 in Ratio = 582
Max Upward Transient Deflection -0.145 in Ratio = 1,651
Max Downward Total Deflection 0.342 in Ratio = 281
Max Upward Total Deflection -0.313 in Ratio = 767

Design OK

*Additional details not transcribed*
Holdowns

This product is preferable to similar connectors because of a) easier installation, b) higher loads, c) lower installed cost, or a combination of these features.

HDU holdowns are prefabricated during the manufacturing process, virtually eliminating deflection under load due to material stretch. They use Simpson Strong-Tie® Strong-Drive® SDS Heavy Duty Connector screws which install easily, reduce fastener slip, and provide a greater net section when compared to bolts.

The DTT tension ties are designed for lighter-duty holdown applications on single 2x posts. The DTT1Z is installed with nails or Simpson Strong-Tie Strong-Drive SD Connector screws and the DTT2Z installs easily with the Strong-Drive SDS Heavy Duty Connector screws (included). The DTT1Z holdowns have been tested for use in designed shearwalls and prescriptive braced wall panels as well as prescriptive wood-deck applications (see p. 337 for deck applications).

For more information on holdown options, contact Simpson Strong-Tie.

HDU Special Features:

- Holdown designs virtually eliminate deflection due to material stretch
- Uses Strong-Drive SDS Heavy Duty Connector screws which install easily, reduce fastener slip, and provide a greater net section area of the post compared to bolts
- Strong-Drive SDS Heavy Duty Connector screws are supplied with the holdowns to ensure proper fasteners are used
- No stud bolts to countersink at openings

Material: See table

Finish: HDU — Galvanized; DTT1Z and DTT2Z — ZMAX® coating; DTT2SS — stainless steel

Installation:

- See General Notes on pp. 75–76
- The HDU requires no additional washer, the DTT requires a standard cut washer (included with DTT2Z) be installed between the nut and the seat
- Strong-Drive SDS Heavy Duty Connector screws install best with a low-speed high-torque drill with a 1/4" hex-head driver

Codes: See p. 14 for Code Reference Key Chart
## Holdowns (cont.)

These products are available with additional corrosion protector. For more information, see p. 18.

1. See pp. 75-76 for Holdown and Tension Tie General Notes.
2. Noted HDU14 allowable loads are based on a 5/8" wide post (6x6 min.).
3. HDU14 requires heavy-hex anchor nut to achieve tabulated loads (supplied with holdown).
4. Loads are applicable to installation on either narrow or wide face of post.

</tr>
</tbody>
</table>

1. The allowable loads listed are based on a safety factor of 4.0.
2. Refer to allowable load-adjustment factors for edge distance on page 176.
3. 100% of the allowable load is permitted at critical spacing. Loads at reduced spacing have not been determined.
4. Drill bit diameter used in base material corresponds to nominal anchor diameter.
5. The minimum concrete thickness is 1 1/4 times the embedment depth.
6. Metal deck must be minimum 20 gauge.
7. Anchors installed in the bottom flutes of the steel deck must have a minimum allowable edge distance of 1 1/4 from the inclined edge of the bottom flute.

</tbody>
</table>

1. The tabulated allowable loads are based on a safety factor of 5.0 for installations under the IBC and IRC.
2. Listed loads may be applied to installations on the face of the CMU wall at least 1" inch away from head joints.
3. Values for 8"-inch wide concrete masonry units (CMU) with a minimum specified compressive strength of masonry, f' m, at 28 days is 1,500 psi.
4. Embedment depth is measured from the outside face of the concrete masonry unit.
5. Drill bit diameter used in base material corresponds to nominal anchor diameter.
6. Allowable loads may be increased 33 1/3% for short-term loading due to wind and seismic forces, where permitted by code.
7. Tension and shear loads for the Wedge-All® anchor may be combined using the parabolic interaction equation (n=P).
8. Refer to allowable load-adjustment factors for edge distance on page 176.

* See page 12 for an explanation of the load table icons.
Masonry Slender Wall

Description: 8-inch CMU

Code References
Calculations per ACI 530-11, IBC 2012, CBC 2013, ASCE 7-10
Load Combinations Used: ASCE 7-10

General Information
Construction Type: Grouted Hollow Concrete Masonry
Fm = 1.50 ksi
Fy - Yielc = 60.0 ksi
Fr - Rupture = 61.0 psi
Em = f' m = 900.0
Max % of P bal. = 0.000633
Grout Density = 140pcf
Block Weight = Normal Weight
Wall Weight = 61.0 psf
Nom. Wall Thickness = 8 in
Actual Thickness = 7.625 in
Rebar 'd' distance = 7.125 in
Lower Level Rebar... Bar Size = #5
Bar Spacing = 24.0 in
Temp Diff across thickness = deg F
Min Allow Out-of-plane Def Ratio = 0
Minimum Vertical Steel % = 0.0020

One-Story Wall Dimensions
A Clear Height = 8.50 ft
B Parapet Height = ft
Wall Support Condition: Top Free, Bottom Fix

Vertical Loads
Vertical Uniform Loads... (Applied per foot of Strip Width)
Ledger Load Eccentricity = 2.0 in
Concentric Load

Lateral Loads
Full area WIND load = 10.0 psf
Fp = Wall Wt. * = 33.184 psf

Wall Weight Seismic Load Input Method: SDS Value per ASCE 12.11.1
S35 = 1.380

ASCE seismic factors entered

Masonry Shear Wall Design Based on TMS 402-11 / 2012 IBC (both ASD and SD)

INPUT DATA & DESIGN SUMMARY
SPECIAL INSPECTION (O=NO, 1=YES) 1 Yes
(Typical option only for local jurisdiction amendments to the code, not part of TMS.)
TYPE OF MASONRY (1=CMU, 2=BRICK) 1 CMU
MASONRY STRENGTH $f_m^0$ = 1.5 ksi
REBAR YIELD STRESS $f_y$ = 60 ksi
ALLOWABLE 30% INCREASING? (IBC 1605.3.2) Yes
SEISMIC PERFORMANCE CATEGORY E Seismic E
(C,D,E, O=WIND, 5=GRAVITY)

SERVICE AXIAL LOAD $P = 1.5$ kips, at middle of $L_w$
SERVICE SHEAR LOAD $V_s = 2$ kips, (in-plane force)
SERVICE MOMENT LOAD $M_x = 17$ ft-kips, (top flange, b1, compression)
$M_y = 2.4$ ft-kips, (out-of-plane, left b11 & b21, compression)

EFFECTIVE HEIGHT OF WALL $h_w = 8.5$ ft
LENGTH OF SHEAR WALL $L_w = 8$ ft, (within vertical control joints)

THE WALL DESIGN IS ADEQUATE.

THICKNESS OF WALL $t_w = 8$ in
REINFORCING OF WALL
$A_{sh}$, Horizontal 2 # 5 @ 24 in o.c.
$A_{sv}$, Vertical 2 # 5 @ 24 in o.c.

TOP FLANGE (COMPRESSION) $b_{11} = 0$ in , $b_{12} = 0$ in , $b_{11} = 8$ in, (TMS 1.9.4.2.3)
$|t| = 0$ in , 2 # 5 @ 48 in o.c., Vertical

BOTTOM FLANGE $b_{21} = 0$ in , $b_{22} = 0$ in , $b_{21} = 8$ in, (TMS 1.9.4.2.3)
$|t| = 0$ in , 2 # 5 @ 48 in o.c., Vertical

ANALYSIS
CHECK FLEXURAL & AXIAL CAPACITY BY ALLOWABLE STRESS DESIGN (ASD)

\[
M (ft-k) = \frac{1.5 \text{ kips}}{P (load)} < \frac{P (allowable)}{P_a} = 302.021 \text{ kips}
\]

Where $E_m = 1350$ ksi, (TMS 1.8.2.2.1)
$E_s = 29000$ ksi, (TMS 1.8.2.1)
Scale Factor = 1.333 , (TMS 2.1.2.3)
$F_y = 0.680$ ksi, (TMS 2.18)
$F_s = 32.00$ ksi, (TMS 2.3.3.1)

$A_h = 744$ in$^2$
$A_{sv} = 2.89$ in$^2$

$I_e \geq 0$ ksi, (TMS 2.3.3.3)
$h / t = 46$ , neglected conservatively flanges.

$P_a = 302.021$ kips, (TMS 2.3.4.2.1)
CHECK FLEXURAL & AXIAL CAPACITY BY STRENGTH DESIGN (SD)

\[ P_u = 1.2 \cdot P = 1.8 \text{ kips} \]
\[ M_n = (1/0.7) \cdot (M_u^2 + M_v^2)^{0.5} = 24.5265 \text{ ft-kips} < \phi P_n = 681.462 \text{ kips, (TMS 402.3.3.4.1.1)} \]
\[ \phi M_n = 523.077 \text{ ft-kips, at } P_u \text{ level.} \]

Where
\[ \varepsilon_{mu} = 0.0025 \text{, (TMS 3.3.2.c)} \]
\[ \phi = 0.9 \text{, (TMS 3.1.4.1)} \]
\[ d = 98 \text{ in} \]
\[ l_m = 1.5 \text{ ksi} \]

CHECK SHEAR CAPACITY (ASD), (TMS 2.3.6)

\[ F_v = \text{MAX} \left( \left( SF \right) \frac{1}{4} \left( 4 - 1.75 \text{MIN} \left( 1, \frac{M_T}{V_d} \right) \right) \sqrt{f_m^2 + 0.25 \frac{P}{A_s}} + 0.5 \frac{A_k F d}{A_s^2}, \left( SF \right) \left[ \frac{1}{2} \left( 4 - 1.75 \text{MIN} \left( 1, \frac{M_T}{V_d} \right) \right) \sqrt{f_m^2 + 0.25 \frac{P}{A_s}} \right] \right) \]
\[ = 83 \text{ psi} > 1.5 f_v = 4 \text{ psi} \]

[Satisfactory]

\[ F_v \text{ Maximum} = \left( SF \right) \text{MIN} \left[ 3, \text{MAX} \left( 2, 2 + \frac{4}{3} \left( 1 - \frac{M_T}{V_d} \right) \right) \right] \sqrt{f_m} = 103 \text{ psi} > 1.5 f_v \]

[Satisfactory]

CHECK MINIMUM REINFORCEMENTS

\[ A_{sh, min} = 0.137 \text{ in}^2/ft < A_{sh, actual} = 0.310 \text{ in}^2/ft \]

[Satisfactory] (TMS 1.18.3.2.6)

\[ S_{sh, max} = 24 \text{ in} > S_{sh, actual} = 24 \text{ in} \]

[Satisfactory] (TMS 1.18.3.2.6)

\[ A_{sv, min} = 0.064 \text{ in}^2/ft < A_{sv, actual} = 0.310 \text{ in}^2/ft \]

[Satisfactory] (TMS 1.18.3.2.6)

\[ S_{sv, max} = 24 \text{ in} > S_{sv, actual} = 24 \text{ in} \]

[Satisfactory] (TMS 1.18.3.2.6)

CHECK MAXIMUM REINFORCEMENT PERCENTAGE

\[ \rho_{\text{max}} = \frac{n f_m}{2 f_c} = 0.0044 > \rho = 0.0008 \]

[Satisfactory] (TMS 402.2.3.4.4)

Page 32 of 93
Determination of Pile Cap Balanced Loads and Reactions

DESIGN CRITERIA
1. PILE TOP SHEAR, Rv, & MOMENT, Rm, RELATIONSHIP MUST BE FROM SOIL REPORT (Rv vs Rm) DIAGRAM. THEY ARE NON-LINEAR SET AND EQUAL AT ALL TOP OF PILES FOR RIGID PILE CAP. USING LINEAR SPRINGS TO MODEL THEM IS INADEQUATE.
2. PILE CAPS SHALL BE INTERCONNECTED BY TIES WITH Min(SD/10, 0.25) TIMES AXIAL VERT COLUMN LOADING. (IBC 1810.3.13). TO CONSIDER CONCRETE TENSION CREAKED, THE TIE BEAM SHOULD NOT BE LATERAL REACTION MEMBER.

INPUT DATA & DESIGN SUMMARY
NUMBER OF HORIZONTAL PILE ROWS 4
NUMBER OF VERTICAL PILE ROWS 3
PILES STAGGERED? No
PILE DIAMETER D = 6 in
PILE CLEAR DISTANCE Clear = 24 in
EDGE DISTANCE Edge = 24 in
PILE CAP HEIGHT H = 18 in
PASSIVE SOIL PRESSURE \( P_P = 200 \text{ pcf} \)

PILE LOCATION TO CENTER OF PILE CAP AND VERTICAL REACTIONS

PILE CAP SIZE

\[ P = \frac{Vv (V_y^2 + V_y^2)^{0.5}}{No.} \]

\[ Rv = 0.4 \text{ kips} \]

\[ Rv = 0 \text{ ft-kips, (from Soil Report per } Rv \text{ above) } \]

Determine Maximum Pile Vertical Reactions

\[ A = 12 \quad 118368 \quad 139392 \quad 26.3 \text{ kips} \]

\[ R_{max} = 26.3 \text{ kips} \quad R_{min} = 26.0 \text{ kips} \]

(The Bold Italic Red values are for pile and pile cap design.)
Concrete Beam

Description: Gage Beam-Pile Cap

**CODE REFERENCES**

Calculations per ACI 318-11, IBC 2012, ASCE 7-10

Load Combination Set: ASCE 7-10

**IBC 2015 GV**

**Material Properties**

- $f'_c = 3.0$ ksi
- $f_{0.8} = 0.85$ ksi
- $f_y = 60.0$ ksi
- $f_{	ext{min}} = 29,000$ ksi

- $\phi$ Values: Flexure: 0.90
- $\beta_1$: Shear: 0.750
- $\lambda$: L/W Factor: 1.0
- $E$: Elastic Modulus: 3,122,000 ksi
- $F$: Stirrups: 60.0 ksi
- $E$: Stirrups: 29,000 ksi
- Number of Resisting Legs Per Stirrup: 2

**Load Combination ASCE 7-10**

**Cross Section & Reinforcing Details**

- Rectangular Section, Width = 12.0 in, Height = 26.0 in
- Span #1 Reinforcing:
  - 1@6 at 6.0 in from Bottom, from 0.0 to 11.0 ft in this span
- Span #2 Reinforcing:
  - 1@6 at 6.0 in from Bottom, from 0.0 to 11.0 ft in this span

**Applied Loads**

- Beam self weight calculated and added to loads
- Load for Span Number 1
  - Uniform Load: $D = 0.1820$, $L = 0.040$, $S = 0.0420$ k/ft, Tributary Width = 1.0 ft, (Gravity)
- Load for Span Number 2
  - Uniform Load: $D = 0.1820$, $L = 0.040$, $S = 0.0420$ k/ft, Tributary Width = 1.0 ft, (Gravity)

**DESIGN SUMMARY**

- Maximum Bending Stress Ratio: 0.161:1
- Typical Section
  - Mu: Applied
  - Mn * Phi: Allowable

- Load Combination
  - +1.400 +1.60H

- Location of maximum on span: 0.000 ft
- Span # where maximum occurs: Span # 2

**Cross Section Strength & Inertia**

- Top & Bottom references are for tension side of section

USGS Design Maps Summary Report

User-Specified Input
Building Code Reference Document  ASCE 7-10 Standard
(which utilizes USGS hazard data available in 2008)

Site Coordinates  47.71°N, 122.18°W
Site Soil Classification  Site Class E - "Soft Clay Soil"
Risk Category  I/II/III

USGS-Provided Output

\[ S_2 = 1.253 \text{ g} \quad S_{MS} = 1.128 \text{ g} \quad S_{PS} = 0.752 \text{ g} \]
\[ S_1 = 0.483 \text{ g} \quad S_{MS1} = 1.159 \text{ g} \quad S_{PS1} = 0.773 \text{ g} \]

For information on how the SS and S1 values above have been calculated from probabilistic (risk-targeted) and deterministic ground motions in the direction of maximum horizontal response, please return to the application and select the "2009 NEHRP" building code reference document.

For PGAw, T, C55, and C45 values, please view the detailed report.
Design Maps Detailed Report

2012/2015 International Building Code (47.71°N, 122.18°W)

Site Class E – "Soft Clay Soil", Risk Category I/II/III

Section 1613.3.1 – Mapped acceleration parameters

Note: Ground motion values provided below are for the direction of maximum horizontal spectral response acceleration. They have been converted from corresponding geometric mean ground motions computed by the USGS by applying factors of 1.1 (to obtain Sₛ) and 1.3 (to obtain Sᵢ). Maps in the 2012/2015 International Building Code are provided for Site Class B. Adjustments for other Site Classes are made, as needed, in Section 1613.3.3.

From Figure 1613.3.1(1) \[ Sₛ = 1.253 \text{ g} \]

From Figure 1613.3.1(2) \[ Sᵢ = 0.483 \text{ g} \]

Section 1613.3.2 – Site class definitions

The authority having jurisdiction (not the USGS), site-specific geotechnical data, and/or the default has classified the site as Site Class E, based on the site soil properties in accordance with Section 1613.

2010 ASCE-7 Standard – Table 20.3-1
SITE CLASS DEFINITIONS

<table>
<thead>
<tr>
<th>Site Class</th>
<th>( \bar{v}_s )</th>
<th>( N ) or ( \bar{N}_{ch} )</th>
<th>( s_u )</th>

<td>See Section 11.4.7 of ASCE 7</td>
</tr>
</tbody>
</table>

Note: Use straight-line interpolation for intermediate values of S<sub>i</sub>

**For Site Class = E and S<sub>i</sub> = 0.483 g, F<sub>i</sub> = 2.400**
Equation (16-37): \[ S_{ns} = F_dS_s = 0.900 \times 1.253 = 1.128 \text{ g} \]

Equation (16-38): \[ S_{m1} = F_sS_1 = 2.400 \times 0.483 = 1.159 \text{ g} \]

Section 1613.3.4 — Design spectral response acceleration parameters

Equation (16-39): \[ S_{ds} = \frac{3}{4} S_{ns} = \frac{3}{4} \times 1.128 = 0.752 \text{ g} \]

Equation (16-40): \[ S_{d1} = \frac{3}{4} S_{m1} = \frac{3}{4} \times 1.159 = 0.773 \text{ g} \]
Section 1613.3.5 — Determination of seismic design category

**TABLE 1613.3.5(1)**
SEISMIC DESIGN CATEGORY BASED ON SHORT-PERIOD (0.2 second) RESPONSE ACCELERATION

<table>
<thead>
<tr>
<th>VALUE OF $S_{oa}$</th>
<th>RISK CATEGORY</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>I or II</td>
</tr>
<tr>
<td>$S_{oa} &lt; 0.167g$</td>
<td>A</td>
</tr>
<tr>
<td>$0.167g \leq S_{oa} &lt; 0.33g$</td>
<td>B</td>
</tr>
<tr>
<td>$0.33g \leq S_{oa} &lt; 0.50g$</td>
<td>C</td>
</tr>
<tr>
<td>$0.50g \leq S_{oa}$</td>
<td>D</td>
</tr>
</tbody>
</table>

For Risk Category = I and $S_{oa} = 0.752$ g, Seismic Design Category = D

**TABLE 1613.3.5(2)**
SFISIMIC DESIGN CATEGORY BASED ON 1-SECOND PERIOD RESPONSE ACCELERATION

<table>
<thead>
<tr>
<th>VALUE OF $S_{os}$</th>
<th>RISK CATEGORY</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>I or II</td>
</tr>
<tr>
<td>$S_{os} &lt; 0.067g$</td>
<td>A</td>
</tr>
<tr>
<td>$0.067g \leq S_{os} &lt; 0.133g$</td>
<td>B</td>
</tr>
<tr>
<td>$0.133g \leq S_{os} &lt; 0.20g$</td>
<td>C</td>
</tr>
<tr>
<td>$0.20g \leq S_{os}$</td>
<td>D</td>
</tr>
</tbody>
</table>

For Risk Category = I and $S_{os} = 0.773$ g, Seismic Design Category = D

Note: When $S_{i}$ is greater than or equal to 0.75g, the Seismic Design Category is E for buildings in Risk Categories I, II, and III, and F for those in Risk Category IV, irrespective of the above.

Seismic Design Category ≡ "the more severe design category in accordance with Table 1613.3.5(1) or 1613.3.5(2)" = D

Note: See Section 1613.3.5.1 for alternative approaches to calculating Seismic Design Category.

Seismic Design Parameters

Per GeoTech report, use Site Class F:

\[ F_a S_b = 1.5 \times (0.9) = 1.35 \times (1.5) = 2.03 \]

\[ F_v S_l = 0.16 \times (2.4) = 1.44 \times (1.5) = 2.16 \]

\[ S_{ds} = \frac{S_{d1}}{1.5} = 1.36 \]

\[ S_{d1} = \frac{S_{d3}}{1.5} = 1.45 \]

Let \( \omega = 1.25 \)

Steel Special Caut. Col. Sys.: \( R_w = 2.5 \)

\[ C_s = \frac{1.34}{2.5/1.0} = 0.54 \]

Wood Sh. Walls: \( R_w = 4.5, \omega = 2.5 \)

Or

Sp. Reinf. CMU: \( R_w = 5, \omega = 2.5 \)

\[ C_s = \frac{1.34}{5/1.0} = 0.27 \]
**Structure Loads**

\[ \text{Roof } DL = 100 (28.67) (32) = 14,777 \text{kN} \]

8" CMU = \[ 22(2) + 18.67(2) + 16.0 + 20.67 + 12 \] (8)(60)

\[ = 672,480 \text{kN} \]

28" Deep Pile Cap = \[ 22(23.33)(23.33)(0.150) \]

\[ = 180 \text{kN} \]

\[ \text{Roof } SL = 25(28.67)(32) = 230,000 \text{kN} \]

**Total Load to Piles:**

\[ DL = 25777 \text{kN} \]

\[ SL = 230kN \]

\[ TL = 280kN \]

6" x 6" Pile Capacity = 30 kN Each

\[ \# \text{ of Piles} = \frac{280}{30} = 9.4 \text{ Piles} \]

\[ \text{For symmetry, use 12 Piles.} \]

\[ \text{Load Pile } = \frac{280}{12} = 23.3kN \]

\[ \text{OK} \]
Roof Seismic Force to Columns:
\[ V_x = 0.54(15) = 8.1 \text{ kN} \]

Roof Seismic Force to Sh-Walls:
\[ V_x = 0.24(15) = 4.0 \text{ kN} \]

Seismic Force to Pile Cap:
\[ V_x = 0.24(14.7 + \frac{1}{2}(62.4)) = 12.4 \text{ kN} \]

Passive Pressure = 200 ksf

28" Deep Pile Cap:
\[ P = \frac{1}{2}(2.33)(200)(2.33)(23.33) \]
\[ = 12.7 \text{ kN} > 12.4 \text{ kN} \quad OK \]
**IBC 2012 1609.6 Alternate All-Heights Wind**

Steel Column

Lic. #: KW-06019241

Description: Typical Column

Code References

Calculations per AISC 360-10, IBC 2012, CBC 2013, ASCE 7-10

Load Combinations Used: ASCE 7-10

IBC 2015

General Information

Steel Section Name: HSS 6x3.250
Analysis Method: Allowable Strength
Steel Stress Grade: 42.0 ksi
E : Elastic Bending Modulus: 29,000.0 ksi
Load Combination: ASCE 7-10

Applied Loads

Column self weight included: 184.405 lbs * Dead Load Factor
AXIAL LOADS... Gravity: Axial Load at 12.0 ft, D = 3.80, S = 5.90 k
BENDING LOADS... EQ: Lat. Point Load at 12.0 ft creating Mx-x, E = 0.840 k

DESIGN SUMMARY

Bending & Shear Check Results
PASS Max. Axial+Bending Stress Ratio = 0.5809 : 1
Load Combination +D+0.750L+0.750S+0.525G+E+H
Location of max.above base 0.0 ft
At maximum location values are...
Pa : Axial 8.409 k
Pn / Omega : Allowable 28.866 k
Ma-x : Applied -5.292 k-ft
Mn-x / Omega : Allowable 16.243 k-ft
Ma-y : Applied 0.0 k-ft
Mn-y / Omega : Allowable 16.243 k-ft

PASS Maximum Shear Stress Ratio = 0.01847 : 1
Load Combination +D+0.70E+H
Location of max.above base 0.0 ft
At maximum location values are...
Va : Applied 0.5880 k
Vn / Omega : Allowable 31.840 k

Maximum SERVICE Load Reactions ...
Top along X-X 0.0 k
Bottom along X-X 0.0 k
Top along Y-Y 0.0 k
Bottom along Y-Y 0.840 k

Maximum SERVICE Load Deflections ...
Along Y-Y 1.630 in at 12.0 ft above base
for load combination: E Only
Along X-X 0.0 in at 0.0 ft above base
for load combination:

Steel Base Plate

Description: Column Base Plate

Code References
Calculations per AISC Design Guide # 1, IBC 2012, CBC 2013, ASCE 7-10
Load Combination Set: ASCE 7-10

General Information

Material Properties
AISC Design Method: Allowable Strength Design
Steel Plate Fy = 36.0 ksi
Concrete Support f’c = 3.0 ksi
Assumed Bearing Area: Full Bearing
\( \Omega_c \): ASD Safety Factor.
Allowable Bearing Fp per J8

Column & Plate

Column Properties
Steel Section: HSS 6x0.250
Depth: 6 in
Width: 6 in
Flange Thickness: 0.233 in
Web Thickness: in

Area: 4.22 in^2
lxx: in^4
lly: in^4

Plate Dimensions
N: Length: 12.0 in
B: Width: 12.0 in
Thickness: 0.750 in

Support Dimensions
Width along X*: 18.0 in
Length along Z*: 18.0 in

Applied Loads

D: Dead Load ....... 2.60 k
L: Live ........... k
Lr: Roof Live ........... k
S: Snow .............. 3.40 k
W: Wind ............. k
E: Earthquake ........ k
H: Lateral Earth .......... k

*P*: Gravity load, *V* sign is downward.
*Z*: Moments create higher soil pressure at +Z edge.
*Y*: Shears push plate towards +Z edge.

Anchor Bolts

Anchor Bolt or Rod Description: 3/4" Dia.
Max of Tension or Pullout Capacity: 8.20 k
Shear Capacity: 7.0 k
Edge distance: bolt to plate: 1.50 in
Number of Bolts in each Row: 2.0
Number of Bolt Rows: 1.0
Steel Base Plate
Lic. #: KW-06010241
Description: Column Base Plate

Tension in each Bolt: 3.411
Allowable Bolt Tension: 8.200
Tension Stress Ratio: 0.410
1 Input data

Anchor type and diameter: Hex Head ASTM F 1554 GR. 36 3/4
Effective embedment depth: $h_{ef} = 9.000 \text{ in.}$
Material: ASTM F 1554
Proof: Design method ACI 318-14 / CIP
Stand-off installation: $e_s = 0.000 \text{ in.} \text{ (no stand-off)}; t = 0.750 \text{ in.}$
Anchor plate: $l_x \times l_y \times t = 12.000 \text{ in.} \times 12.000 \text{ in.} \times 0.750 \text{ in.};$ (Recommended plate thickness: not calculated
Profile: Round HSS, Steel pipe (AISC); $(L \times W \times T) = 6.000 \text{ in.} \times 6.000 \text{ in.} \times 0.250 \text{ in.}$
Base material: cracked concrete, 3000, $f'_c = 3.000 \text{ psi}; h = 18.000 \text{ in.}$
Reinforcement: tension: condition B, shear: condition B;
edge reinforcement: $\geq$ No. 4 bar
Seismic loads (cat. C, D, E, or F) Tension load: yes (17.2.3.4.3 (c))
Shear load: yes (17.2.3.5.3 (b))

R - user is responsible to ensure a rigid base plate for the entered thickness with appropriate solutions
(stiffeners, ...)

\( \beta_{H,V} = \beta_{H} + \beta_{V} \leq 1 \)
6 Warnings

- The anchor design methods in PROFIS Anchor require rigid anchor plates per current regulations (ETAG 001/Annex C, EOTA TR029, etc.). This means load redistribution on the anchors due to elastic deformations of the anchor plate are not considered - the anchor plate is assumed to be sufficiently stiff, in order not to be deformed when subjected to the design loading. PROFIS Anchor calculates the minimum required anchor plate thickness with FEM to limit the stress of the anchor plate based on the assumptions explained above. The proof if the rigid base plate assumption is valid is not carried out by PROFIS Anchor. Input data and results must be checked for agreement with the existing conditions and for plausibility!

- Condition A applies when supplementary reinforcement is used. The $\Phi$ factor is increased for non-steel Design Strengths except Pullout Strength and Pryout strength. Condition B applies when supplementary reinforcement is not used and for Pullout Strength and Pryout Strength. Refer to your local standard.

- Checking the transfer of loads into the base material and the shear resistance are required in accordance with ACI 318 or the relevant standard!

- An anchor design approach for structures assigned to Seismic Design Category C, D, E or F is given in ACI 318-14, Chapter 17, Section 17.2.3.4.3 (a) that requires the governing design strength of an anchor or group of anchors be limited by ductile steel failure. If this is NOT the case, the connection design (tension) shall satisfy the provisions of Section 17.2.3.4.3 (b), Section 17.2.3.4.3 (c), or Section 17.2.3.4.3 (d). The connection design (shear) shall satisfy the provisions of Section 17.2.3.5.3 (a), Section 17.2.3.5.3 (b), or Section 17.2.3.5.3 (c).

- Section 17.2.3.4.3 (b) / Section 17.2.3.5.3 (a) require the attachment the anchors are connecting to the structure be designed to undergo ductile yielding at a load level corresponding to anchor forces no greater than the controlling design strength. Section 17.2.3.4.3 (c) / Section 17.2.3.5.3 (b) waive the ductility requirements and require the anchors to be designed for the maximum tension / shear that can be transmitted to the anchors by a non-yielding attachment. Section 17.2.3.4.3 (d) / Section 17.2.3.5.3 (c) waive the ductility requirements and require the design strength of the anchors to equal or exceed the maximum tension / shear obtained from design load combinations that include E, with E increased by $\Phi_D$.

Fastening meets the design criteria!
7 Installation data

Anchor plate, steel: -
Profile: Round HSS, Steel pipe (AISC); 6.000 x 6.000 x 0.250 in.
Hole diameter in the fixture: \( d_f = 0.813 \) in.
Plate thickness (input): 0.750 in.
Recommended plate thickness: not calculated

Anchor type and diameter: Hex Head ASTM F 1554 GR. 36 3/4
Installation torque: -
Hole diameter in the base material: - in.
Hole depth in the base material: 9.000 in.
Minimum thickness of the base material: 10.000 in.

\( ^R \) - user is responsible to ensure a rigid base plate for the entered thickness with appropriate solutions (stiffeners,...)

8 Remarks; Your Cooperation Duties

- Any and all information and data contained in the Software concern solely the use of Hilti products and are based on the principles, formulas and security regulations in accordance with Hilti's technical directions and operating, mounting and assembly instructions, etc., that must be strictly complied with by the user. All figures contained therein are average figures, and therefore use-specific tests are to be conducted prior to using the relevant Hilti product. The results of the calculations carried out by means of the Software are based essentially on the data you put in. Therefore, you bear the sole responsibility for the absence of errors, the completeness and the relevance of the data to be put in by you. Moreover, you bear sole responsibility for having the results of the calculation checked and cleared by an expert, particularly with regard to compliance with applicable norms and permits, prior to using them for your specific facility. The Software serves only as an aid to interpret norms and permits without any guarantee as to the absence of errors, the correctness and the relevance of the results or suitability for a specific application.

- You must take all necessary and reasonable steps to prevent or limit damage caused by the Software. In particular, you must arrange for the regular backup of programs and data and, if applicable, carry out the updates of the Software offered by Hilti on a regular basis. If you do not use the AutoUpdate function of the Software, you must ensure that you are using the current and thus up-to-date version of the Software in each case by carrying out manual updates via the Hilti Website. Hilti will not be liable for consequences, such as the recovery of lost or damaged data or programs, arising from a culpable breach of duty by you.
1 Input data

Anchor type and diameter: Hex Head ASTM F 1554 GR. 36 3/4
Effective embedment depth: $h_{ef} = 9.000$ in.
Material: ASTM F 1554
Proof: Design method ACI 318-14 / CIP
Stand-off installation: $e_b = 0.000$ in. (no stand-off); $t = 0.750$ in.
Anchor plate: $l_1 \times l_2 \times t = 12.000$ in. x $12.000$ in. x $0.750$ in.; (Recommended plate thickness: not calculated
Profile: Round HSS, Steel pipe (AISC); (L x W x T) = $6.000$ in. x $6.000$ in. x $0.250$ in.
Base material: cracked concrete, 3000, $f'_c = 3,000$ psi; $h = 18.000$ in.
Reinforcement:
tension: condition B, shear: condition B;
edge reinforcement: $\geq$ No. 4 bar
Seismic loads (cat. C, D, E, or F)
Tension load: yes (17.2.3.4.3 (c))
Shear load: yes (17.2.3.5.3 (b))

\( \beta_{h,v} = \beta_h + \beta_v \leq 1 \)
6 Warnings

- The anchor design methods in PROFIS Anchor require rigid anchor plates per current regulations (ETAG 001/Annex C, EOTA TR029, etc.). This means load re-distribution on the anchors due to elastic deformations of the anchor plate are not considered - the anchor plate is assumed to be sufficiently stiff, in order not to be deformed when subjected to the design loading. PROFIS Anchor calculates the minimum required anchor plate thickness with FEM to limit the stress of the anchor plate based on the assumptions explained above. The proof if the rigid base plate assumption is valid is not carried out by PROFIS Anchor. Input data and results must be checked for agreement with the existing conditions and for plausibility!

- Condition A applies when supplementary reinforcement is used. The Φ factor is increased for non-steel Design Strengths except Pullout Strength and Pryout strength. Condition B applies when supplementary reinforcement is not used and for Pullout Strength and Pryout Strength. Refer to your local standard.

- Checking the transfer of loads into the base material and the shear resistance are required in accordance with ACI 318 or the relevant standard!

- An anchor design approach for structures assigned to Seismic Design Category C, D, E or F is given in ACI 318-14, Chapter 17, Section 17.2.3.4.3 (a) that requires the governing design strength of an anchor or group of anchors be limited by ductile steel failure. If this is NOT the case, the connection design (tension) shall satisfy the provisions of Section 17.2.3.4.3 (b), Section 17.2.3.4.3 (c), or Section 17.2.3.4.3 (d). The connection design (shear) shall satisfy the provisions of Section 17.2.3.5.3 (a), Section 17.2.3.5.3 (b), or Section 17.2.3.5.3 (c).

- Section 17.2.3.4.3 (b) / Section 17.2.3.6.3 (a) require the attachment the anchors are connecting to the structure be designed to undergo ductile yielding at a load level corresponding to anchor forces no greater than the controlling design strength. Section 17.2.3.4.3 (c) / Section 17.2.3.5.3 (b) waive the ductility requirements and require the anchors to be designed for the maximum tension / shear that can be transmitted to the anchors by a non-yielding attachment. Section 17.2.3.4.3 (d) / Section 17.2.3.5.3 (c) waive the ductility requirements and require the design strength of the anchors to equal or exceed the maximum tension / shear obtained from design load combinations that include E, with E increased by 0.9.

Fastening meets the design criteria!
7 Installation data

Anchor plate, steel:
Profile: Round HSS, Steel pipe (AISC); 6.000 x 5.000 x 0.250 in.
Hole diameter in the fixture: \( d_f = 0.813 \text{ in.} \)
Plate thickness (input): 0.750 in.
Recommended plate thickness: not calculated

Anchor type and diameter: Hex Head ASTM F 1554 GR. 36 3/4
Installation torque: -
Hole diameter in the base material: - in.
Hole depth in the base material: 9.000 in.
Minimum thickness of the base material: 10.000 in.

R - user is responsible to ensure a rigid base plate for the entered thickness with appropriate solutions (stiffeners,...)

8 Remarks; Your Cooperation Duties

- Any and all information and data contained in the Software concern solely the use of Hilti products and are based on the principles, formulas and security regulations in accordance with Hilti's technical directions and operating, mounting and assembly instructions, etc., that must be strictly complied with by the user. All figures contained therein are average figures, and therefore use-specific tests are to be conducted prior to using the relevant Hilti product. The results of the calculations carried out by means of the Software are based essentially on the data you put in. Therefore, you bear the sole responsibility for the absence of errors, the completeness and the relevance of the data to be put in by you. Moreover, you bear sole responsibility for having the results of the calculation checked and cleared by an expert, particularly with regard to compliance with applicable norms and permits, prior to using them for your specific facility. The Software serves only as an aid to interpret norms and permits without any guarantee as to the absence of errors, the correctness and the relevance of the results or suitability for a specific application.

- You must take all necessary and reasonable steps to prevent or limit damage caused by the Software. In particular, you must arrange for the regular backup of programs and data and, if applicable, carry out the updates of the Software offered by Hilti on a regular basis. If you do not use the AutoUpdate function of the Software, you must ensure that you are using the current and thus up-to-date version of the Software in each case by carrying out manual updates via the Hilti Website. Hilti will not be liable for consequences, such as the recovery of lost or damaged data or programs, arising from a culpable breach of duty by you.

**INSTALLATION NOTES:**
1. Prepared surfaces, such as sand and concrete, are not acceptable for use under your structure.
2. The consumer is responsible to check with local utilities prior to excavation for any underground utilities that may exist.
3. The consumer is responsible to check for proper approval of the proposed installation site.
4. This structure is to be installed on a level and flat surface.
5. The consumer is responsible to prepare the surface by leveling and grading the site area, and installing a base material suitable for the intended use.
6. The base material must be below the frost line.
7. Do not install the framework on support posts in concrete, as the framework is not designed to be used in such conditions.
8. Additional information and instructions are provided with your structure prior to beginning construction.

**SITE NOTES:**
1. The installation area is to be a minimum width of 1200mm (48"") and a minimum depth of 1000mm (39.37"").
2. The framework is to be installed on a level and flat surface.
3. The consumer is responsible to check with local utilities prior to excavation for any underground utilities that may exist.
4. The consumer is responsible to prepare the surface by leveling and grading the site area, and installing a base material suitable for the intended use.
5. The base material must be below the frost line.
6. The installation area is to be a minimum width of 1200mm (48"") and a minimum depth of 1000mm (39.37"").
7. The framework is to be installed on a level and flat surface.
8. Additional information and instructions are provided with your structure prior to beginning construction.

Survey Summary

On November 14, 2018, Jon Havelock, Eric Jarvis and Jason Carlson of Med-Tox Northwest (MTNW) conducted a hazardous building materials (HBM) survey of the property located at 12031 Northeast Totem Lake Way in Kirkland, Washington. This work was conducted on behalf of O’Neill Service Group. The building was occupied at the time of the survey; however, at the request of property management, only limited destructive sampling was allowed.

This report identifies building materials that contain asbestos, estimates the quantity of asbestos-containing material (ACM) present and documents building materials that potentially contain lead-based paint (LBP), polychlorinated biphenyls (PCBs), and other hazardous materials that require removal or management as part of demolition activities. Washington Administrative Code (WAC) 296-155-775 requires identification of asbestos and hazardous materials and their hazards eliminated before demolition is started.

As required by WAC 296-62-077 and Puget Sound Clean Air Agency (PSCAA), building inspectors certified under the Asbestos Hazard Emergency Response Act (AHERA) and employed by MTNW conducted the asbestos portion of the survey. Copies of the inspector’s AHERA Building Inspector certificate and Washington Department of Commerce (WDOC) LBP Inspector/Risk Assessor certificates are included in Appendix A.

No previous HBM surveys or as-built construction documents were available as part of the survey.

Building Information

Photographic documentation of the structure and the major systems described herein are provided in Appendix B.

General and Structural: Originally constructed in 1979 the structure at 12031 NE Totem Lake Way is approximately 7000 square feet (SF) in size. The building is currently occupied by two different companies which use their areas as office space. Prior to the current tenants, this building was used as a retail store.

There is one main floor to the building with the addition of a second tier wrap around storage area. The interior of the building is divided into three main areas; an entry way and two office spaces. The entryway consists of two restrooms, a custodial closet, and one office room.

Office 1 is composed of a main office area, a long meeting room, a back-office area, a conference room, a closet area, a bathroom, and an electrical room. Office 2 consisted of one open office space with a closet space in the SE corner.
The building is constructed on a concrete slab foundation, is wood-framed and finished with plywood siding on the bottom portion and silver rib-metal paneling on the upper portion. Exterior windows were vinyl-framed, and aluminum-framed with steel rebar stretching horizontally over the interior portion of the windows. Interior doors are hollow core wood and metal, exterior doors were metal and wood framed. The roof is a combination of a pitched roof and built up roof. The pitched roof sections of the building were finished with brown rib-metal paneling. The built-up roofing system was inaccessible during the time of the survey. The roof for the entrance overhang was finished with gray rib-metal paneling.

A 120 SF detached wood-framed shed is located east of the southeast section of the building. The shed was finished with the same plywood siding as the building. The roof was finished with multiple layers of asphalt roofing shingles. The interior walls and ceiling of the shed were finished with sprayed on yellow foam insulation.

**Heating and Mechanical Systems:** Heat for the building is provided by electric baseboards and central heating, ventilation, and air conditioning (HVAC) system. Pipes that were observed either had a polyethylene wrap or they were un-insulated.

**Walls/Ceiling:** Interior walls of the building were finished with a heavy textured gypsum wallboard (GWB) system, an orange peel textured GWB system, untextured GWB, lap wood siding, and vinyl sheet board. Bathroom walls were finished with ceramic wall tiles. In addition, walls were also finished with wood, brick, ceramic tile, and vinyl cove base. Ceilings of the building were finished with a heavy textured GWB system, an orange peel textured GWB system, untextured GWB, or horizontal wood planks.

**Floor Systems:** Floors of the building were primarily a concrete sub-floor, with wood sub-floor found in elevated areas of Office 1. Offices and the entry way were primarily finished with glued-down carpet. Office 1 and 2 also had parquet wood tiles, sheet vinyl tiles, sheet vinyl flooring (SVF), and ceramic tiles. Bathrooms floors were finished with ceramic tiles.

**Asbestos Survey**

The AHERA regulation, 40 Code of Federal Regulation (CFR) 763, is the primary governing regulation when performing asbestos surveys. This regulation was originally enacted for school buildings but has since been applied to public and commercial buildings by the Asbestos School Hazard Abatement Reauthorization Act (ASHARA) in 1994 and by the Occupational Safety and Health Administration’s (OSHA) worker protection regulations in 1995, specifically 29 CFR 1926.1101(k).

PSCAA also requires compliance with AHERA’s survey and sampling requirements. This applies to any renovation or demolition activities where suspect ACM may be disturbed. PSCAA is a local agency that receives statutory authority from the U.S. Environmental Protection Agency (EPA) to enforce environmental regulations.
AHERA divides suspect ACM into three categories; “surfacing materials” (i.e., sprayed fireproofing, popcorn ceiling texture, etc.), “thermal system insulation” (TSI) (i.e., pipe or building insulation, etc.), and “miscellaneous materials” (i.e., flooring material, roofing, construction mastics, etc.). The following sections summarize the potential ACMs identified for each of these three categories. For a complete listing of suspect materials sampled, see Appendix C. See Appendix J for drawings of asbestos and lead sample locations and material types.

The following sections summarize the potential ACMs identified by homogeneous material (HM) description as they relate to each of the AHERA categories and clarify location along with the number of samples collected for regulatory compliance.

**Surfacing Materials**

There were four surfacing materials observed in the building.

- **Heavy Troweled Textured GWB system (HM-01).** HM-01 was the identified on the walls throughout the building. Nine samples of HM-01 were collected between the two offices and entrance. After being analyzed for asbestos content HM-01 was determined to be negative for asbestos.

- **Untextured GWB (HM-02).** Untextured GWB was present in the entrance area and in Office 1. Five samples were collected between the two areas and analyzed for asbestos content; HM-02 was found to be negative for asbestos.

- **Orange peel textured GWB system (HM-03).** Orange peel textured GWB was present in the entrance area restrooms, entry way office, custodial closet, and in the conference room of Office 1. Seven samples of HM-03 were collected from seven different locations then analyzed for asbestos content. HM-03 was found to be negative for asbestos.

- **Sprayed on yellow foam insulation (HM-26).** HM-26 was observed on the walls and ceilings of the shed. Three samples of HM-26 were collected and analyzed for asbestos content; no asbestos detected.

**Thermal System Insulation**

There was one TSI material observed in the building.

- **Pink wall insulation (HM-23).** HM-23 was found in an exposed area of the wall inside the electrical room. Three samples were collected and analyzed for asbestos content; no asbestos was detected.

**Miscellaneous Materials**

- **Wall laminate board with yellow mastic (HM-04).** HM-04 was identified on the NW wall of the meeting room in Office 1. Two samples of HM-04 were collected and analyzed for asbestos content. HM-04 was determined to be negative for asbestos.
Wall laminate board with orange mastic (HM-05). HM-05 was identified on the N wall of the meeting room hallway in Office 1. Two samples of HM-05 were collected and analyzed for asbestos content; HM-05 was determined to be negative for asbestos.

Wall laminate board with brown mastic (HM-06). HM-06 was found in the NW corner of the meeting room in Office 1 on the E wall. Two samples were collected and analyzed for asbestos content; no asbestos was detected.

3- x 3-inch brown wall tile with grout (HM-07). HM-07 was present in the men’s and women’s restroom. Two samples were collected and analyzed for asbestos content; this material was determined to be negative for asbestos.

3- x 3-inch brown wall with yellow and green mastic (HM-08). HM-08 was found in the men’s restroom. Two samples were collected and analyzed for asbestos content; no asbestos was detected.

6- x 6-inch red floor tile with grout (HM-09). This material was present in Office 2, the electric room, and both the men’s and women’s restroom. Two samples were collected and analyzed for asbestos content; no asbestos was detected.

Dark gray and red carpet with yellow mastic (HM-10). HM-10 was present in the entry way, Office 1, and Office 2. Three samples (one from each area) were collected and analyzed for asbestos content; HM-10 was found to be negative for asbestos.

Blue and gray carpet with yellow mastic (HM-11). HM-11 was present in the entry way, Office 1, and Office 2. Three samples (one from each area) were collected and analyzed for asbestos content; HM-11 was found to be negative for asbestos.

Parquet wood floor tile with white mastic and grout (HM-12). HM-12 was identified in the main office area of Office 1. Two samples were collected and analyzed for asbestos content; no asbestos was detected.

Parquet wood floor tile with dark yellow mastic (HM-13). HM-13 was identified in Office 2. Two samples were collected and analyzed for asbestos content; no asbestos was detected.

12- x 12-inch green and yellow SVT with yellow mastic (HM-14). HM-14 was discovered in the main office of Office 1 under HM-10. Two samples were collected and analyzed for asbestos content; no asbestos was detected.

6- x 6-inch brown/white square pattern SVF with brown binder (HM-15). This material was observed in the electrical room hallway. Three samples were collected and analyzed for asbestos; no asbestos was detected.
Brick wall base with white paint and grout (HM-16). This material was observed in the NW corner of the meeting room in Office 1. Two samples were collected and analyzed for asbestos; no asbestos was detected.

Gray wall base grout with white paint (HM-17). This material was found in the conference room of Office 1. Two samples were collected and analyzed for asbestos content; no asbestos was detected.

Black vinyl cove base with yellow mastic (HM-18). HM-18 was identified in the entry way office. Two samples were collected and analyzed for asbestos content; this material was determined to be negative for asbestos.

Gray vinyl cove base with brown mastic (HM-19). HM-19 was identified in Office 2. Two samples were collected and analyzed for asbestos content; HM-19 was determined to be negative for asbestos.

Tan cove base with yellow mastic (HM-20). HM-20 was identified in the SE bathroom of Office 1. Two samples were collected and analyzed for asbestos content; no asbestos was detected.

Brown wall base sealant (HM-21). HM-21 found along the N wall of the meeting room hallway in Office 1. Two samples were collected and analyzed for asbestos content; no asbestos was detected.

Exterior window caulking (HM-22). This material was observed on exterior window frames. Three samples were collected and analyzed for asbestos; this material was determined to be negative for asbestos.

Wall VBP (HM-24). HM-24 was found under the GWB of the second level storage area. Three samples were collected and analyzed for asbestos content; no asbestos was detected.

Asphalt roofing shingles and VBP (HM-25). The shed roof was covered by multiple layers of asphalt roof shingles with VBP over the plywood sheathing. Three samples were collected and analyzed for asbestos content; no asbestos was detected.

Table 1 summarizes ACM identified in the residence surveyed by MTNW.

Lead-Based Paint Summary

Lead was commonly used in most paint products until 1978, when it was banned from residential paints at concentrations greater than 600 parts per million (ppm) and then reduced to 90 ppm in 2012; however, commercial applications with lead are still utilized and available. Lead is poisonous to the human body and presents a potential health hazard during any kind of disturbance (such as maintenance, including grinding,
welding, and cutting) and if improperly disposed, where lead can enter drinking water supplies.

EPA defines LBP as a concentration of 1.0 milligrams per square centimeter (mg/cm²) or greater by x-ray fluorescence (XRF) or 0.5 percent in weight (% wt.) or greater by total lead analysis; equivalent to 5,000 milligrams per kilogram (mg/kg). This EPA action level triggers requirements for protection of the environment, maintenance workers, and building occupants in child occupied facilities as defined by 40 CFR 745. Additionally, building components exceeding EPA lead levels may cause demolition waste streams to fail waste designation sampling performed for compliance with WAC 173-303 Dangerous Waste Regulations.

Washington Department of Occupational Safety and Health (DOSH) worker protection regulations have not defined a minimum concentration for regulating lead and has clarified that lead at any detectable concentration shall be considered regulated by WAC 296-155-176, Lead. Paint sample results can be expressed in mg/kg (same as ppm), % wt. or mg/cm² by area depending on the type of analytical method used. Any positive result, regardless of the reporting method by the laboratory, will require compliance with WAC 296-155-176.

Lead in Painted Surfaces

Interior painted surfaces were tested for lead content using bulk sample collection and chemical analysis. A total of nine paint chip samples were collected. Analytical results are provided in Table 3.

Waste Designation Survey

Construction waste or demolition debris expected as a result of 8808.2 consists of most of the building materials due to limited recycling value for the type of construction. Due to no Pb, toxicity characteristic leaching procedure (TCLP) samples were not collected.

All nine samples analyzed were determined to contain lead less than the detection limit of the analytical method. Based on these results, the demolition waste from the building can be disposed of as general construction debris.

Other Hazardous Building Materials

Chlorofluorocarbons

MTNW inspected the building for cooling systems with potential chlorofluorocarbons (CFCs); none were observed.

PCB Light Ballasts and Fluorescent Light Tubes

Older fluorescent light ballasts have small capacitors that may contain high concentrations of PCBs. Nearly all ballasts manufactured before 1979 contain PCBs. All ballasts manufactured after July 1, 1978 that do not contain PCBs are required to be clearly marked "No PCBs". Unmarked ballasts or ballasts without a date code should be assumed to be PCB ballasts. PCBs are toxic chemicals according to the EPA. While there is only a small amount, about one ounce, of PCBs in each light ballast capacitor, there are a large number of ballasts in the United States. A "No PCB" label means there are less than 50 ppm PCBs; however, in the state of Washington, PCB in oils are regulated at 2 ppm (WAC 173-303-9904).

There were fluorescent light fixtures observed at 8808.2. Smoke detectors may be regulated as universal or hazardous waste and will require dismantling and special handling. Table 4 provides a summary of these items in the building:

Table 4. Summary of Fluorescent Lights and Smoke Detectors

<table>
<thead>
<tr>
<th>Location</th>

<td>54</td>
<td>32</td>
<td>7</td>
<td>8</td>
<td>25</td>
</tr>
</tbody>
</table>

Note: This table is not to be used without the complete survey document including appendices for additional information.

Typically, there is one ballast for every two-light tubes in a fluorescent light fixture; accordingly, there are approximately two ballasts in the light fixture requiring recycling or PCB hazardous waste disposal. There are also four four-foot tubes that will need to be recycled during demolition along individual 4-foot tubes.
PCB in Caulking and Paint

PCBs were used in paint and caulk formulations as drying oils (resins) and plasticizers or softening agents (liquids). Concrete surfaces and equipment, as well as marine or waterproofing applications may have painted surfaces containing PCBs.

PCBs were tested in representative caulking and paint on the exterior of 12031. Table 6 below provides a summary of PCB sample results.

Mercury Containing Switches

Heating system thermostats were investigated for mercury containing systems. All the thermostats observed were electric.

Laboratory Analytical Methods

Asbestos-Containing Materials

Bulk samples were analyzed by Polarized Light Microscopy (PLM) dispersion staining EPA Method 600/R-93/116 and by 400 Point Count Analysis by Seattle Asbestos Test (SAT). SAT is accredited through the National Voluntary Laboratory Accreditation Program (NVLAP) of the U.S. Department of Commerce. This accreditation does not constitute endorsement, but rather a finding of laboratory competence. The NVLAP participant number for SAT is 200768-0 (certification copies are in Appendix D). Analytical results are in Appendix E.

Lead-Based Paint

Bulk paint chip samples were submitted to EMSL Analytical, Inc. for analysis using atomic absorption spectroscopy (AAS) to determine the presence and percentage of lead. Procedures for analyzing metals are found in the American Society of Testing and Materials (ASTM) D-3335-78 and EPA Method Manual SW-846, Method 6010. EMSL used SW 846-7000B, an equivalent analytical method.
Analytical results for paint chip results are provided in Appendix F. EMSL Analytical, Inc., laboratory certification is attached in Appendix G.

Sample and material location drawings are provided in Appendix I.

**PCB**

Bulk PCB samples were submitted to On-Site Environmental, Inc., for analysis using gas chromatography (GC) equipped with electron capture detectors (ECD). The samples were analyzed using EPA Method SW-846 8082A and the analytical results are provided in Appendix H. On-Site Environmental, Inc. laboratory certification is attached in Appendix I.

Sample and material location drawings are provided in Appendix J.
Comments and Recommendations

Asbestos-Containing Materials

MTNW recommends that this survey report be placed on-site during renovation and/or demolition and copies provided to the contractor(s) bidding and performing work. Washington Industrial Safety and Health Act (WISHA), OSHA and PSCAA require that the report be on-site and available for review during the entire project duration.

No materials containing asbestos content were found during the survey. The building was occupied at the time of the survey. A limited destructive investigation was conducted during the survey; however, additional destructive investigation will be required prior to demolition.

1. Electrical systems were not sampled due to power being live. Sample and verify that asbestos is not present prior to building demolition.

2. The doors to the structure did not appear to be fire doors with suspect asbestos content. Prior to any activity that will impact the doors, drill into the doors and door frames to determine if suspect fire protection is located inside.

3. Perform destructive investigation inside wall and ceiling cavities to verify suspect asbestos is not hidden or present prior to demolition.

4. Perform destructive investigation to verify if additional layers of flooring suspected of containing asbestos are not hidden or present prior to demolition.

5. If during demolition, pipe or pipe fitting insulation suspected of containing ACM is made visible, the material(s) must be sampled by an AHERA building inspector prior to being disturbed.

WAC 296-65 requires ACM be removed by trained and licensed contractors using certified asbestos abatement workers and supervisors (except for deregulated roofing sealants, mastics, and coatings). A 10-day prior notification is also required before abatement can begin. In addition, PSCAA requires notification and fees prior to beginning removal of friable ACM.

If additional destructive investigations uncover asbestos-containing materials, MTNW recommends third party oversight of asbestos abatement and renovation activities by an AHERA accredited building inspector to ensure regulatory compliance and completion of the additional destructive methods recommended herein.

Lead-Based Paint

Lead in painted surfaces were not detected in this building. All samples were analyzed to contain lead less than the detection of the analytical method and based on these results, the demolition waste from the building can be disposed of as general construction debris.

Hazardoub Building Materials Survey – Totem Lake Way

PCB

There were no PCB’s detected in the bulk samples collected. MTNW recommends that the asbestos abatement contractor be tasked with dismantling light fixtures, collecting all lighting ballasts for proper disposal, and recycling the light tubes. Ballasts without “No-PCB” labels are considered PCB-containing and must be disposed as a hazardous waste. “No-PCB” and Di (2-ethylhexyl) phthalate (DEHP) ballasts may designate as Washington Dangerous Waste and should be sent to an EPA licensed facility for proper disposal.

Other Hazardous Building Materials

Smoke detectors should be collected and recycled/disposed of appropriately.

Limitations

A good faith effort has been made to identify ACM, LBP and other HBM in preparation for building demolition. This survey was performed for complete demolition of the building. Additional destructive investigation and sampling will be required depending on inaccessible building systems including mechanical spaces and/or mechanical/electrical system routing.

Sampling was performed consistent with the level of care and skill ordinarily exercised by professionals currently practicing under similar conditions in the area. No other warranty, expressed or implied, is made.

This report has been prepared for the exclusive use of O’Neill Service Group and it designates for this project only. The analyses, conclusions, and recommendations presented in this report are based on conditions encountered at the time of our survey and our experience and judgment. MTNW cannot be held responsible for interpretation by others of the data contained in this report; any use of this report shall include the entire document. This survey is not intended for use as abatement plans and/or specifications which MTNW recommends for regulatory compliance.

Certificate of Completion

This is to certify that

Eric T. Jarvis

has satisfactorily completed

24 hours of training as an

AHERA Building Inspector
to comply with the training requirements of
TSCA Title II, 40 CFR 763 (AHERA)

EPA Provider # 1085

Instructor

Certificate Number: 169779

Exam Score: 88.1

Date(s) of Training: Oct 15 - 17, 2018

Expiry in 1 year.

ARGUS PACIFIC, INC. / 21965 64th Ave W. Suite 100 / Mountlake Terrace, Washington 98043 / 206.285.3373 / ARGUSPACIFIC.COM
Certificate of Completion

This is to certify that

Jason S. Carlson

has satisfactorily completed

4 hours of refresher training as an

AHERA Building Inspector

to comply with the training requirements of

TSCA Title II, 40 CFR 763 (AHERA)

Sep 12, 2018

Date(s) of Training

Exam Score: N/A

If appropriate:

Expires in 1 year.

169363

Instructor

EPA Provider # 1085

ARGUS PACIFIC, INC. / 7900 WEST NICKERSON ST, SUITE 315 / SEATTLE/WASHINGTON 98119 / 206.285.3373 / ARGUSPACIFIC.COM
Appendix B
Building and Building System Photographic Documentation
Photo 1: West side of 8808.2 looking east.

Photo 2: Northwest corner of building looking east.
Photo 3: Northeast corner of building looking southwest. Wood deck patio area enclosed by a wood fence. Windows at 88008.2 have rebar over the windows internally for security purposes.

Photo 4: East side-south end of building looking west. A detached shed is located east of the building. The area is fenced off with the same metal siding that is found on the main structure.
Photo 5: Southwest corner of the building looking northeast.

Photo 6: View of entry area looking east. Office 1 is to the right and Office 2 straight ahead. To the left are the restrooms, janitors closet, and entry area office.
Photo 7: View of upper storage area in entry area facing west. The previous tenants built miniature store fronts along the upper level for decorative purposes.

Photo 8: Men's restroom looking northwest. The women’s restroom is composed of the same building materials.
Photo 9: Office 1 – Main office area looking south.

Photo 10: Looking east into the long meeting room of Office 1 from the south end of the main office area.
Photo 11: From the north end of the long meeting room looking east down the conference room hallway. To the right is the conference room, straight ahead is a storage closet.

Photo 12: North end of conference room facing south.
Photo 13. North end of conference room looking east. The blanket on the wall is used to cover the doorway that leads to the electrical room and the exit for the storage shed.

Photo 14. North end of electric room hallway facing south towards the electrical room.
Photo 15. Electric room facing south.

Photo 16. Looking east from the door of the east office space in Office 1.
Photo 17. West side of Office 2 at entrance looking northeast.

Photo 18. West side of Office 2 at entrance looking southeast.

Photo 20. North end top view of Office 2 from upper storage area facing south.
Photo 21. Upper storage area of entry way facing west.

Photo 22. Upper storage area northwest corner perimeter wall.
Photo 23. Storage area north wall above Office 2.

Photo 24. North of detached shed facing south.
Photo 25. South door of shed with yellow sprayed on foam insulation.

Photo 26. South door way of shed facing southeast. Yellow foam insulation covers the interior walls and ceiling of the shed.
Photo 27. South doorway of shed facing north.

Photo 28. Southeast corner of shed, floors of the shed are bare concrete.

*Analysis following Lead in Paint by EMSL SOP/Determination of Environmental Lead by FLAA. Reporting limit is 0.010 % wt based on the minimum sample weight per our SOP. Unless noted, results in this report are not blank corrected. This report relates only to the samples reported above and may not be reproduced, except in full, without written approval by EMSL. EMSL bears no responsibility for sample collection activities. Samples received in good condition unless otherwise noted. "<" (less than) result signifies that the analyte was not detected at or above the reporting limit. Measurement of uncertainty is available upon request. The QC data associated with the sample results included in this report meet the recovery and precision requirements unless specifically indicated otherwise. Definitions of modifications are available upon request.

acknowledges that

EMSL Analytical, Inc.
6340 Castleplace Drive, Indianapolis, IN 46250
Laboratory ID: 157245

along with all premises from which key activities are performed, as listed above, has fulfilled the requirements of the AIHA Laboratory Accreditation Programs (AIHA-LAP), LLC accreditation to the ISO/IEC 17025:2005 international standard, *General Requirements for the Competence of Testing and Calibration Laboratories* in the following:

**LABORATORY ACCREDITATION PROGRAMS**

- **INDUSTRIAL HYGIENE**
  - Accreditation Expires: June 01, 2019
- **ENVIRONMENTAL LEAD**
  - Accreditation Expires: June 01, 2019
- **ENVIRONMENTAL MICROBIOLOGY**
  - Accreditation Expires: June 01, 2019
- **FOOD**
  - Accreditation Expires:
- **UNIQUE SCOPES**
  - Accreditation Expires:

Specific Field(s) of Testing (FoT)/Method(s) within each Accreditation Program for which the above named laboratory maintains accreditation is outlined on the attached *Scope of Accreditation*. Continued accreditation is contingent upon successful on-going compliance with ISO/IEC 17025:2005 and AIHA-LAP, LLC requirements. This certificate is not valid without the attached *Scope of Accreditation*. Please review the AIHA-LAP, LLC website ([www.aihaaccreditedlabs.org](http://www.aihaaccreditedlabs.org)) for the most current Scope.

William Walsh, CIH
Chairperson, Analytical Accreditation Board

Cheryl O. Morton
Managing Director, AIHA Laboratory Accreditation Programs, LLC

Revision 15: 03/30/2016

Date Issued: 05/31/2017
The laboratory is approved for those specific field(s) of testing/methods listed in the table below. Clients are urged to verify the laboratory’s current accreditation status for the particular field(s) of testing/Methods, since these can change due to proficiency status, suspension and/or withdrawal of accreditation.

The EPA recognizes the AIHA-LAP, LLC ELLAP program as meeting the requirements of the National Lead Laboratory Accreditation Program (NLLAP) established under Title X of the Residential Lead-Based Paint Hazard Reduction Act of 1992 and includes paint, soil and dust wipe analysis. Air and composited wipes analyses are not included as part of the NLLAP.

Environmental Lead Laboratory Accreditation Program (ELLAP)

Initial Accreditation Date: 09/01/2002

Analytical Results – PCBs
November 28, 2018

Jon Havelock  
MED-TOX  
P.O. Box 1146  
Auburn, WA 98071

Re: Analytical Data for Project 8808.2  
Laboratory Reference No. 1811-194

Dear Jon:

Enclosed are the analytical results and associated quality control data for samples submitted on November 21, 2018.

The standard policy of OnSite Environmental, Inc. is to store your samples for 30 days from the date of receipt. If you require longer storage, please contact the laboratory.

We appreciate the opportunity to be of service to you on this project. If you have any questions concerning the data, or need additional information, please feel free to call me.

Sincerely,

[Signature]

David Baumeister  
Project Manager

Enclosures
Date of Report: November 28, 2018
Samples Submitted: November 21, 2018
Laboratory Reference: 1811-194
Project: 8808.2

Case Narrative

Samples were collected on November 14, 2018 and received by the laboratory on November 21, 2018. They were maintained at the laboratory at a temperature of 2°C to 6°C.

Please note that any and all soil sample results are reported on a dry-weight basis, unless otherwise noted below.

General QA/QC issues associated with the analytical data enclosed in this laboratory report will be indicated with a reference to a comment or explanation on the Data Qualifier page. More complex and involved QA/QC issues will be discussed in detail below.

Data Qualifiers and Abbreviations

A - Due to a high sample concentration, the amount spiked is insufficient for meaningful MS/MSD recovery data.

B - The analyte indicated was also found in the blank sample.

C - The duplicate RPD is outside control limits due to high result variability when analyte concentrations are within five times the quantitation limit.

E - The value reported exceeds the quantitation range and is an estimate.

F - Surrogate recovery data is not available due to the high concentration of coeluting target compounds.

H - The analyte indicated is a common laboratory solvent and may have been introduced during sample preparation, and be impacting the sample result.

I - Compound recovery is outside of the control limits.

J - The value reported was below the practical quantitation limit. The value is an estimate.

K - Sample duplicate RPD is outside control limits due to sample inhomogeneity. The sample was re-extracted and re-analyzed with similar results.

L - The RPD is outside of the control limits.

M - Hydrocarbons in the gasoline range are impacting the diesel range result.

M1 - Hydrocarbons in the gasoline range (toluene-naphthalene) are present in the sample.

N - Hydrocarbons in the lube oil range are impacting the diesel range result.

N1 - Hydrocarbons in diesel range are impacting lube oil range results.

O - Hydrocarbons indicative of heavier fuels are present in the sample and are impacting the gasoline result.

P - The RPD of the detected concentrations between the two columns is greater than 40.

Q - Surrogate recovery is outside of the control limits.

S - Surrogate recovery data is not available due to the necessary dilution of the sample.

T - The sample chromatogram is not similar to a typical ____________.

U - The analyte was analyzed for, but was not detected above the reported sample quantitation limit.

U1 - The practical quantitation limit is elevated due to interferences present in the sample.

V - Matrix Spike/Matrix Spike Duplicate recoveries are outside control limits due to matrix effects.

W - Matrix Spike/Matrix Spike Duplicate RPD are outside control limits due to matrix effects.

X - Sample extract treated with a mercury cleanup procedure.

X1 - Sample extract treated with a sulfuric acid/silica gel cleanup procedure.

Y - The calibration verification for this analyte exceeded the 20% drift specified in method 8260C, and therefore the reported result should be considered an estimate. The overall performance of the calibration verification standard met the acceptance criteria of the method.

Z -

ND - Not Detected at PQL

PQL - Practical Quantitation Limit

RPD - Relative Percent Difference

Phase I and Limited Phase II Environmental Site Assessment Final Report  
12031 Totem Lake Way  
Parcel Number 692840-0032  
Kirkland, Washington 98034  

Dear Mr. Baker,  

Attached, please find our Phase I and Limited Phase II Environmental Site Assessment (ESA) for King County Parcel 692840-0032 located at 12031 Totem Lake Way (Subject Property). During the survey and research, our staff interviewed the current owner of the Subject Property and reviewed the Subject Property and its history. The report was completed according to the terms and conditions authorized by you. This report has been completed in general conformance with the ASTM Standard E 1527-13. An executive summary is provided; however, we recommend that the report be read in its entirety for a comprehensive understanding of the items contained therein.  

This report is addressed to the City of Kirkland and such other persons as may be designated by City of Kirkland and their respective successors and assigns. There are no intended or unintended third-party beneficiaries to this report, except as expressly stated herein.  

O’Neill Service Group (OSG) is an independent contractor, not an employee of either the issuer or the borrower, and its compensation was not based on the findings or recommendations made in the report or on the closing of any business transaction.  

We declare that, to the best of our professional knowledge and belief, we meet the definition of Environmental Professional as defined in §312.10 of 40 CFR 312 and we have the specific qualifications based on education, training, and experience to assess a property of the nature, history, and setting of the Subject Property. We have developed and performed the all appropriate inquiries in conformance with the standards and practices set forth in 40 CFR Part 312.
We appreciate the opportunity to provide environmental consulting services to the City of Kirkland. Should you have any questions or require additional information, please do contact the undersigned.

Respectfully submitted,
O’Neill Service Group

Executive Summary

At the request of the City of Kirkland, O’Neill Service Group (OSG) has performed a Phase I and Limited Phase II Environmental Site Assessment (ESA) of the vacant property located at 12031 Totem Lake Way in Kirkland, Washington herein referred to as the Subject Property. The main objective of this ESA was to identify recognized environmental conditions associated with the Subject Property, defined in ASTM Practice E 1527-13 as the presence or likely presence of any hazardous substances or petroleum products that indicate an existing release, a past release, or a material threat of a release. This ESA also includes a preliminary evaluation of certain potential environmental conditions that are outside the scope of ASTM Practice E 1527-13.

The Subject Property includes one irregular-shaped parcel totaling approximately 1.6 acres. The Subject Property is currently being utilized as office space. The parcel consists of an approximately 7,000 square foot retail/commercial building, with associated asphalt-paved parking and landscaped areas. The property is currently used for office and parking space associated with construction activities at an adjacent parcel. There are currently no manufacturing or industrial operations conducted at the Subject Property.

Following our site visit and review of the historical documents associated with the Subject Property, no recognized environmental conditions (REC) were identified. However, based on conversations with the client, an assessment of soils exposed to treated timber piles supporting the building was requested. OSG collected selected soil samples adjacent to timber piles uncovered during a site geotechnical investigation. One soil sample collected during the assessment contained regulated concentrations of petroleum hydrocarbons and carcinogenic polynuclear aromatic hydrocarbons. Additional characterization and management of disturbed soils during construction is recommended. No other RECs were identified through historic review, site interviews, or environmental database review.

Below is the Assessment Summary Table presenting our recommended actions for the Subject Property. OSG findings and opinions are presented in Section 9.0, and recommendations for further action or investigation are presented in Section 10.0.

Key: NA - Not Applicable
1.0 INTRODUCTION

O’Neill Service Group (OSG) has completed a Phase I Environmental Site Assessment (ESA) and Limited Phase II ESA for the property located at 12031 Totem Lake Way in Kirkland, Washington. This work was conducted under contract to City of Kirkland and outlined in our Phase I and Limited Phase II ESA Proposal (Scope A), dated September 28, 2018. This study was conducted to assist the City of Kirkland with the plans to acquire the subject property as part of the future development of Totem Lake Park.

1.1 Purpose

The purpose of this ESA was to identify recognized environmental conditions (RECs) and certain environmental conditions outside the scope of ASTM Practice E 1527-13 about the property at the time of the property reconnaissance.

1.2 Scope-of-Services

This ESA was conducted utilizing a standard of good commercial and customary practice that was consistent with the ASTM Practice E 1527-13. Significant scope-of-work additions, deletions or deviations to ASTM Practice E 1527-13 are noted below or in the corresponding sections of this report. The scope-of-work for this assessment included an evaluation of the following:

- Physical characteristics of the Subject Property through a review of referenced sources for topographic, geologic, soils and hydrologic data.
- Subject Property history through a review of referenced sources such as land deeds, fire insurance maps, city directories, aerial photographs, prior reports, and interviews.
- Current Subject Property conditions, including observations and interviews regarding the following: the presence or absence of hazardous substances or petroleum products; generation, treatment, storage, or disposal of hazardous, regulated, or biomedical waste; equipment that utilizes oils which potentially contain PCBs; and storage tanks (aboveground and underground).
- Usage of surrounding area properties and the likelihood for releases of hazardous substances and petroleum products (if known and/or suspected) to migrate onto the Subject Property.
- Information in referenced environmental agency databases and local environmental records, within specified minimum search distances.
- Past ownership through a review of available prior reports and local municipal file review.
This Assessment also includes consideration of the following potential environmental conditions that are outside the scope of ASTM Practice E 1527-13: asbestos-containing materials (ACM), and Lead-Based Paint (LBP).

1.3 Assumptions, Limitations and Exceptions

This Phase I ESA has been prepared for the use of the City of Kirkland, in accordance with our Standard Conditions for Engagement and Authorization Letter and Agreement for Environmental Services approved and signed by the City of Kirkland, and with the limitations described below, all of which are integral parts of this report. A copy of the signed agreement is maintained at the OSG office in Redmond, Washington.

OSG has performed this Phase I ESA in general conformance with the scope and limitations of ASTM Standard E 1527-13, Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process. This Phase I ESA has been prepared to assess a parcel of commercial real estate with respect to the range of contaminants within the scope of the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) (42 U.S.C. §9601) and petroleum products. As such, this practice is intended to permit the City of Kirkland to satisfy one of the requirements to qualify for the innocent landowner, contiguous property owner, or bona fide prospective purchaser limitations on CERCLA liability: that is, the practices that constitute “all appropriate inquiry into the previous ownership and uses of the Subject Property consistent with good commercial or customary practice” as defined in 42 U.S.C. § 9601(35)(B).

In defining a standard of good commercial and customary practice for conducting an environmental site assessment of a parcel of property, the goal of the processes established by this practice is to identify recognized environmental conditions. The term recognized environmental conditions means the presence or likely presence of any hazardous substances or petroleum products on a property under conditions that indicate an existing release, a past release, or a material threat of a release of any hazardous substances or petroleum products into structures on the property or into the ground, ground water, or surface water of the property. The term includes hazardous substances or petroleum products even under conditions in compliance with laws. The term is not intended to include de minimis conditions that generally do not present a threat to human health or the environment and that generally would not be the subject of an enforcement action if brought to the attention of appropriate
governmental agencies. Conditions determined to be de minimis are not recognized environmental conditions.

The information reported was obtained through sources deemed reasonably ascertainable, as defined in ASTM Standard E 1527-13; a visual site survey of areas readily observable, easily accessible or made accessible by the Subject Property contact and interviews with owners, agents, occupants, or other appropriate persons involved with the Subject Property. Municipal information was obtained through review of reasonably ascertainable standard government record sources and interviews with the authorities having jurisdiction over the Subject Property. Findings, conclusions, and recommendations included in the report are based on our visual observations in the field, the municipal information reasonably obtained, information provided by the Client, and/or a review of readily available and supplied documents and drawings. OSG relies completely on the information, whether written, graphic, or verbal, provided by the Subject Property contact or as shown on any documents reviewed or received from the Subject Property contact, owner or agent, or municipal source, and assumes that information to be true and correct. Although there may have been some degree of overlap in the information provided by these various sources, OSG did not attempt to independently verify the accuracy or completeness of the information reviewed or received during the course of these environmental services.

The observations in this report are valid on the date of the assessment. Where access to portions of the Subject Property or to structures on the Subject Property was unavailable or limited, OSG renders no opinion as to the presence of hazardous substances or petroleum products in that portion of the Subject Property or structure. Inaccessible portions of the Subject Property are described below. In addition, OSG renders no opinion as to the presence of, or indirect evidence relating to, hazardous substances or petroleum products where direct observation of the interior walls, floor, or ceiling of a structure was obstructed by objects or coverings on or over these surfaces.

It is acknowledged that OSG judgments shall not be based on scientific or technical tests or procedures beyond the scope of the Services or beyond the time and budgetary constraints imposed by the Client. It is acknowledged further that OSG conclusions do not rest on pure science but on such considerations as economic feasibility and available alternatives. Client also acknowledges that, because geologic and soil formations are inherently random, variable, and indeterminate in nature, the Services and opinions provided under this Agreement with respect to such Services are not guaranteed to be a representation
of actual conditions on the Subject Property, which are also subject to change with time as a result of natural or man-made processes, including water permeation. In performing the Services, OSG shall use that degree of care and skill ordinarily exercised by environmental consultants or engineers performing similar services in the same or similar locality. The standard of care shall be determined solely at the time the Services are rendered and not according to standards utilized at a later date. The Services shall be rendered without any other warranty, expressed or implied, including, without limitation, the warranty of merchantability and the warranty of fitness for a particular purpose.

Client and OSG agree that to the fullest extent permitted by law, OSG shall not be liable to Client for any special, indirect or consequential damages whatsoever, whether caused by OSG negligence, errors, omissions, strict liability, breach of contract, breach of warranty or other cause or causes whatsoever.

The ASTM Standard E 1527-13 does not encompass analytical testing to evaluate asbestos containing materials, radon, lead-based paint, drinking water quality, indoor air quality, stored chemicals, debris, fill materials, surface water, or subsurface samples (soil and groundwater) as part of a Phase I ESA. Analytical testing performed at the Subject Property has been conducted in accordance with the Standard Conditions for Engagement and Authorization Letter and Agreement for Environmental Services and the client-specific Scope of Work. Unless otherwise specified herein, such testing involves screening methods intended to provide a broad and approximate evaluation of conditions at readily accessible portions of the Subject Property, limited by project constraints, and should not be construed as a comprehensive program designed to comply with a specific regulatory program. If a thorough and regulatory-compliant study is warranted based on the findings of the Phase I ESA, OSG will recommend the appropriate further investigation. In certain cases, quantitative laboratory testing is performed as part of the assessment and analyses have been conducted by an outside laboratory. OSG relies upon the data provided by the outside laboratory, and has not conducted an independent evaluation of the reliability of this data.

The assessment was conducted in a manner consistent with the level of care and skill ordinarily exercised by members of the profession, and in accordance with generally accepted practices of other consultants currently practicing in the same locality under similar conditions. No other representation, expressed or implied, and no warranty or guarantee is included or intended. The report speaks only as of its date, in the absence of a specific written update of the report, signed and delivered by OSG.
Additional information that becomes available after our survey and draft submission concerning the Subject Property should be provided to OSG so that our conclusions may be revised and modified if necessary, at additional cost. This report has been prepared in accordance with our Standard Conditions for Engagement, which is an integral part of this report.

1.4 Special Terms and Conditions

This Phase I ESA has been prepared to assist the City of Kirkland in its proposed acquisition of Subject Property. This report can be relied upon by only the parties stated in the transmittal letter at the front of this report. OSG liability to a purchaser wishing to use this report is limited to the cost of the report. Amendments to OSG limitations as stated herein that may occur after issuance of the report are considered to be included in this report. Payment for the report is made by, and OSG contract and report extends to the City of Kirkland only, in accordance with our Agreement.

1.5 Data Gaps

Any data gaps identified herein, as defined by ASTM Practice E 1527-13 § 3.2.20, are not considered to have significantly affected the ability to identify recognized environmental conditions in connection with the Subject Property and do not alter the conclusions of this report.
2.0 SUBJECT PROPERTY DESCRIPTION

2.1 Ownership and Location

According to the King County Assessor’s Office, the Subject Property is currently owned by the City of Kirkland.

The Subject Property is located at 12031 Totem Lake Way in Kirkland, King County, Washington. The Subject Property consists of one irregularly shaped parcel, identified by the King County Department of Assessments as Parcel Number 692840-0032 totaling 1.6 acres. The parcel consists of an approximately 7,000 square foot retail/commercial building, with associated asphalt-paved parking and landscaped areas. The building was constructed in 1979 and is in inhabitable condition. Figures are included as Appendix A. Figure 1 - Site Plan depicts the configuration of the Subject Property and adjoining properties. Figure 2 – Topographic Map depicts the location of the Subject Property on the Kirkland, Washington United States Geological Survey (USGS) 7.5 Minute Topographic Quadrangle. Figure 3 - Location Map depicts the location of the Subject Property and proximity to the neighboring properties on an aerial photo of Kirkland, Washington.

2.2 Subject Property Improvements

The parcel is developed with an approximately 7,000 square foot wood framed retail/commercial building, with associated asphalt-paved parking and landscaped areas. The building was constructed in 1979.

2.3 Current Use of the Subject Property

At the time of this assessment, the Subject Property was developed for commercial use. The on-site building was being utilized as construction engineering and management offices associated with property redevelopment on the parcels adjacent north of Totem Lake Way.

2.4 Municipal Services and Utilities

The Subject Property is serviced by the following municipal services and utilities, listed on Table 1, below:
### TABLE 1
#### MUNICIPAL SERVICES AND UTILITIES

<table>
<thead>

3.0 USER PROVIDED INFORMATION

The following section summarizes information provided by City of Kirkland with regard to this Phase I ESA. A User Questionnaire was forwarded to the City personnel with knowledge of the Subject Property. The information requested in the User Questionnaire is intended to assist in gathering information that may be material to identifying recognized environmental conditions in connection with the Subject Property. The User Questionnaire and any additional documentation referenced below are presented in Appendix B.

3.1 Title Records

Title record information associated with the Subject Property has not been provided to OSG by City of Kirkland. A detailed discussion regarding review of information obtained from other sources is presented in Section 4.3.5 of this report.

3.2 Environmental Liens and Activity and Use Limitations

City of Kirkland has provided no information regarding environmental liens or activity and use limitations in connection with the Subject Property. A detailed discussion regarding environmental liens is presented in Section 4.3.7 of this report. A detailed discussion regarding activity and use limitations is presented in Sections 4.1.1 and 4.1.2 of this report.

3.3 Specialized Knowledge

City of Kirkland provided two geotechnical reports prepared by Earth Consultants, Inc. in 1978 and by Associated Earth Sciences, Inc. (AESI) in 2017. The Earth Consultants report documented the geotechnical investigation consisting of three borings in the footprint of the proposed retail building. Based on the site soil conditions, Earth Consultants recommended supporting the building foundation on pressure treated timber piles as one alternative due to site soil conditions.

AESI completed three soil boring on the Subject Property. One boring was completed as a monitoring well to document site water levels. Two additional borings were completed off the Subject Property for future boardwalk construction associated with Totem Lake park development.
OSG was not provided with or made aware of previous environmental assessments or other documentation that is material to recognized environmental conditions in connection with the Subject Property, except as presented in Section 4.5.8 of this report.

3.4 Commonly Known or Reasonably Ascertainable Information

No commonly known or reasonably ascertainable information was identified during this assessment.

3.5 Valuation Reduction for Environmental Issues

City of Kirkland has provided no information regarding valuation reduction for environmental issues in connection with the Subject Property.

3.6 Owner, Property Manager, and Occupant Information

City of Kirkland is the current property owner of the parcel. No other information was provided.

3.7 Reason for Performing Phase I ESA

City of Kirkland retained OSG to complete this Phase I ESA in connection with a property redevelopment and planning process.
4.0 RECORDS REVIEW

4.1 Standard Environmental Records

A review of standard environmental databases maintained by federal, state, and tribal offices was completed through Environmental Data Resources, Inc. (EDR) of Shelton, Connecticut. The databases were searched for properties with reported environmental conditions located within approximate minimum search distances as specified by ASTM Standard E 1527-13, by using geocoding information that identified the coordinates of the properties in the databases or by checking the street addresses of practically reviewable non-geocoded “orphan” properties within the same zip code. The database report is presented in Appendix C.

It should be noted that plotted locations of listed sites are not always accurate. With regard to listings that are determined or suspected to be inaccurate, based on information from other sources such as direct observation or consultation with individual’s familiar with the property, OSG uses the best available data when evaluating the location of listed sites discussed below.

The following Table 3 provides a summary of the findings of the environmental database report. Specific properties identified within the database report are further discussed below.

4.1.1 Federal Agency Database Records

**National Priority List (NPL)**

The NPL database, also known as the Superfund List, is a subset of CERCLIS and identifies sites that are ranked as high priority for remedial action under the Federal Superfund Act. Neither the Subject Property nor any sites located within one mile of the Subject Property were identified on the NPL.

**Delisted National Priority List (NPL)**

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425(e), sites may be deleted from the NPL where no further response is appropriate. Neither the Subject Property nor any sites located within ½ mile of the Subject Property were identified on the Delisted NPL database.

**Comprehensive Environmental Response, Compensation and Liability Information System (CERCLIS)**

CERCLIS contains data regarding potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies, and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation and Liability ACT (CERCLA). CERCLIS contains sites that are included on the National Priority List (NPL), as well as sites which are in the screening and assessment phase for possible inclusion on the NPL. Neither the Subject Property nor any sites located

</table>
within ½ mile of the Subject Property were identified on the CERCLIS database.

**CERCLIS – No Further Remedial Action Planned (CERCLIS-NFRAP)**

As of February 1995, CERCLIS sites designated as No Further Remedial Action Planned (NFRAP) have been removed from the CERCLIS list. NFRAP sites may be sites where, following an initial investigation, no contamination was found, contamination was removed without the need for the site to be placed on the NPL, or the contamination was not considered sufficient to warrant Federal Superfund action or NPL consideration. Neither the Subject Property nor any sites located within ½ mile of the Subject Property were identified on the CERCLIS-NFRAP database.

**Resource Conservation and Recovery Act (RCRA) – Corrective Action Tracking System (CORRACTS)**

RCRAInfo is EPA’s comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. RCRAInfo replaces the data recording and reporting abilities of the Resource Conservation and Recovery Information System (RCRIS). The database includes selective information regarding sites that generate, transport, store, treat, and/or dispose of hazardous waste as defined by RCRA. The RCRA-CORRACTS database identifies TSD facilities that have conducted, or are currently conducting, corrective action(s) as regulated under RCRA. Neither the Subject Property nor any sites located within one mile of the Subject Property were identified on the RCRA CORRACTS database.

**RCRA non-CORRACTS Treatment, Storage and/or Disposal (TSD) Facilities**

RCRA non-CORRACTS Treatment, Storage and/or Disposal (TSD) facilities are required to register hazardous waste activity under the Resource Conservation and Recovery Act (RCRA). Neither the Subject Property nor any sites located within ½ mile of the Subject Property were identified on the RCRA non-CORRACTS TSD database.

**RCRA Hazardous Waste Generators**

Hazardous waste generators tracked under the Resource Conservation and Recovery Act (RCRA) are classified as either Large Quantity Generators (LQGs), Small Quantity Generators (SQGs), or Conditionally Exempt Small Quantity Generators (CESQG). A RCRA-LQG is defined as a facility that generates over 1,000 kilograms (Kg) of hazardous waste, or over 1 Kg of acutely hazardous waste per
A RCRA-SQG is defined as a facility that generates between 100 Kg and 1,000 Kg of hazardous waste per month. A RCRA-CESQG is defined as a facility that generates less than 100 Kg of hazardous waste, or less than 1 Kg of acutely hazardous waste per month. The Subject Property was not identified on the RCRA Generator database. One Small Quantity Generator, and three Conditionally-Exempt Small Quantity Generators were identified on the RCRA Generator database. These listings are generally not under consideration as RECs unless their accompanying sites are also listed as having releases.

Federal Engineering Control / Institutional Control Registries

The completion of site cleanup activities may include the implementation of engineering controls or institutional controls as part of the response action. Engineering controls include various forms of caps, building foundations, liners, and treatment methods to create pathway elimination for regulated substances to enter environmental media or effect human health. Institutional controls include administrative measures, such as groundwater use restrictions, construction restrictions, property use. The Subject Property was not identified on Federal Engineering Control or Institutional Control Registries.

Emergency Response Notification System (ERNS)

ERNS is a national database used to collect information regarding reported releases of petroleum products and/or hazardous substances. The database contains information from spill reports submitted to Federal agencies, including the EPA, the U.S. Coast Guard, the National Response Center, and the U.S. Department of Transportation. A review of this database was conducted in order to determine whether any spills or incidents involving releases of hazardous substances or petroleum products have occurred at the Subject Property. The Subject Property was not identified on the ERNS database.

4.1.2 State and Tribal Agency Database Records

State and Tribal Equivalent NPL Sites and CERCLIS Sites

State and tribal equivalent NPL and CERCLIS databases were searched for sites located within one mile of the Subject Property. The Subject Property was not included on either list. Two equivalent NPL sites were found within one mile of the Subject Property, and twelve CERCLIS (CSCSL) sites were found within one mile of the Subject Property.
State and Tribal Landfill Sites and Solid Waste Disposal Sites

The state and tribal landfill and solid waste disposal site databases identify active or inactive landfill and transfer station facilities, as well as open dumps that failed to meet RCRA Subtitle D Section 4004 criteria for solid waste landfills or disposal sites. The Subject Property was not included on the list. One site located within ½ mile of the Subject Property was identified on state or tribal landfill and solid waste disposal site databases.

State and Tribal Leaking Storage Tank Sites

Leaking Storage Tank Sites are properties where releases of hazardous substances or petroleum products from underground storage tanks (USTs) and/or aboveground storage tanks (ASTs) have been identified and reported to state, tribal, or local agencies. The Subject Property was not included on the list. Six sites within ½ mile of the Subject Property were identified in state or tribal leaking storage tank databases.

State and Tribal Registered Storage Tanks

The Underground Storage Tank database contains registered USTs, which are regulated under Subtitle I of RCRA and documented by the Department of Ecology. The Subject Property was not included on the list. Two adjoining properties were identified on state or tribal registered storage tank databases.

State and Tribal Engineering Control / Institutional Control Registries

The completion of site cleanup activities may include the implementation of engineering controls or institutional controls as part of the response action. Engineering controls include various forms of caps, building foundations, liners, and treatment methods to create pathway elimination for regulated substances to enter environmental media or effect human health. Institutional controls include administrative measures, such as groundwater use restrictions, construction restrictions, property use restrictions, and post remediation care requirements intended to prevent exposure to contaminants remaining on site. Deed restrictions are generally required as part of the institutional controls. The Subject Property was not identified on state or tribal Engineering Control or Institutional Control Registries. One property within ½ mile was included on the list.
**State and Tribal Voluntary Cleanup Sites**

The Subject Property was not identified on state or tribal Voluntary Cleanup Site databases. The Subject Property was not included on the list. Five Voluntary Cleanup Program (VCP) sites and ten Independent Cleanup (ICR) sites were located within ½ mile of the Subject Property.

**State and Tribal Brownfield Sites**

The Subject Property was not included on the list. One site located within ½ mile of the Subject Property was identified on state or tribal Brownfield Sites databases.

4.1.3 Local Regulatory Agency Records

Local offices consulted during the completion of this assessment included the City of Kirkland Planning and Public Works and Planning & Building Departments, as well as the City of Kirkland Fire Department. OSG requested agency information regarding the Subject Property via the City’s online inquiries form. None of the three requested departments had significant documentation of past usage, ownership, building permits, or hazardous materials relating to the Subject Property. OSG did not identify documented adverse environmental conditions, violations, or complaints associated with the Subject Property.

4.1.4 Subject Site

EDR reports the standard environmental record sources required for review under ASTM Standard E1527-13 do not include listings for facilities on the subject property parcels.

4.1.5 Adjoining Properties

EDR reports the standard environmental record sources required for review under ASTM Standard E1527-13 do not include listings for properties adjoining the Subject Property. Although the EDR report lists several sites within 0.25 mile of the Subject Property, several of the listings are on multiple lists, or have multiple names for a single site. Additionally, geocoding of sites, particularly those with multiple addresses or large parcels, may be inaccurate. OSG reviewed the sites listed on the EDR report on the Washington Department of Ecology Toxics Cleanup database (https://fortress.wa.gov/ecy/neighborhood/). Four properties within 1/8 mile were identified. Table 4 summarizes the sites:
### Table 4

</tbody>
</table>

**Totem Lake Dry Cleaners:** The site is part of the State Voluntary Cleanup Program. The original release was reported in 1998, as a release of halogenated solvents to soil and groundwater. A Cleanup Action Plan Report (GeoDesign, 2017) described multiple investigations and remedial actions taken at the site to remediate the solvent. The extent of solvent was found to be within the footprint of the former dry cleaner site, at the southeast corner of the Totem Lake shopping Center, which is north-northwest of the Subject Property. Investigations determined that the contamination did not migrate off-site. The Cleanup Action Plan provided a design for injection of reagents for chemical remediation of the remnant solvent. An opinion letter provided by the Department of Ecology (dated January 16, 2018) stated that, based on the proposed work plan, that a No Further Action determination for the site was likely after completion of remedial efforts and monitoring. A No Further Action has not yet been provided for the site. Based on the lack of evidence of off-site migration of contaminants from the site, OSG does not consider the Totem Lake Dry Cleaners site to constitute a REC at the Subject Property.

**Totem Lake Chevron:** The site is part of the State Voluntary Cleanup Program. The original release was reported in 2012, with documentation of the removal of a waste oil UST at the site. Additional UST removal and soil excavation took place in 2017. Three gasoline and one diesel fuel USTs were removed from the site, as well as a heating oil UST discovered on the north end of the site. Dispensers associated with the supply USTs were also removed. Approximately 300 cubic yards of petroleum-contaminated soil were removed from the site and disposed of at a licensed facility. Impacted groundwater was not reported. Based on the findings of the remedial action report, Ecology issued a No Further Action determination in April, 2017 (Ecology, 2017). Based on the lack of evidence of off-site migration of contaminants and NFA determination, OSG does not consider the Totem Lake Chevron site to constitute a REC at the Subject Property.
**Brown Bear Car Wash:** The site is on the LUST list and was formerly a combined car wash and gas station. According to a Site Hazard Assessment completed by Ecology in 2013, the original petroleum release was discovered in 1990 during UST removal. Subsequent subsurface investigations and remediations removed 400 cubic yards of contaminated soil. Diesel range petroleum hydrocarbons were remediared to below cleanup levels. Groundwater contamination was identified, and the site gradient was found to be to the north-northeast. Overall, contamination was located at the western end of the site, in the vicinity of the former USTs. Groundwater monitoring and remediation took place between 1995 and 1999. The most recent report available to the Ecology reviewers in 2005 noted that remnant gasoline-range petroleum contamination in groundwater was constrained to one well in the western (upgradient) portion of the site. Groundwater samples in all other monitoring wells on the site did not contain detectable concentrations of petroleum hydrocarbons. Ecology performed a Site Hazard Assessment based on the available data (Ecology, 2013). According to the assessment findings, the site was assigned a rating of ‘4’ out of 5, or low risk of exposure to the environment and humans. Based on the lack of evidence of off-site migration of contaminants and low-risk Site Hazard Assessment determination, OSG does not consider the Brown Bear Car Wash site to constitute a REC at the Subject Property.

**Circle V Management Property:** Available online documentation for the site was limited. However, the cleanup site details summary available from Ecology documented that the original LUST release was reported in 1995. Ecology performed an assessment of the site in 2011 and prepared a No Further Action opinion in 2012 (Ecology, 2012). The No Further Action letter concluded that soil had been contaminated by a waste oil release. Groundwater was not affected. Per the documentation available to Ecology, soil remediation at the site met state cleanup levels. Based on the lack of evidence of off-site migration of contaminants and NFA determination, OSG does not consider the Circle V Management Property site to constitute a REC at the Subject Property.

### 4.1.6 Non-Adjoining Properties

EDR reports the standard environmental record sources required for review under ASTM Standard E1527-13 include listings of non-adjoining properties situated within the respective search distance including two Ecology CSCSL sites, two Ecology LUST sites (likely the above-discusses sites), three Ecology ICR sits, and two Ecology CSCSL NFA facilities. These facilities are situated in positions that appear hydrologically non-tributary of the Subject Property, based on the topography, and/or are at
such a distance from the Subject Property that it is unlikely the reported contamination would migrate to the Subject Property.

4.1.7 Tribal Records

EDR provides information on Indian UST, LUST, VCP, open dumps, and brownfields and EDR reports those records do not include listings for facilities on the Subject Property, adjoining properties, or non-adjointing properties situated within the requisite ASTM Standard E1527-13 search distances. Additionally, the Subject Property is not within the reservation boundaries of a federally recognized Indian tribe according to Ecology’s “Tribal Land and Reservations” map.

4.2 Additional Environmental Record Sources

Included in the EDR report are additional federal and state environmental records not required for review under ASTM Standard E1527-13. The additional records are listed beginning on page 4 of the EDR report map findings summary. A review revealed 17 listings within the EDR-specified search distances. Most of the sites appear on what EDR brands as “Allsites” databases and includes Ecology’s Facility/Site Identification Listing, which is a compendium of all sites under the jurisdiction of various agency programs. The “Allsites” sites appear to reside in locations that are sufficiently distant, and/or is inferred, based on topography, to be hydro-geologically cross/down gradient in relation to the Subject Property. Therefore, it is unlikely that possible contamination at these facilities have adversely impacted the Subject Property.

The EDR report may also include "EDR proprietary records" which are non-regulatory listings that EDR considers as "high risk historical records". The "high risk" records include automotive filling/service stations and dry cleaners that are typically listed in archived business directories. The EDR proprietary records are listed in the EDR report and are not required for review under ASTM Standard E 1527-13.

4.3 Orphan Sites

The EDR report includes a listing of “Orphan” sites that EDR is unable to map because of insufficient location information. Based on a review of facility address information provided by EDR, the two listed orphan sites appear to be located outside of the search distances in Practice ASTM Standard E1527-13, and do not appear to represent a significant environmental risk to the subject property.
4.4 Physical Setting

4.4.1 Regional Physiographic Conditions

The Subject Property is situated on a rolling upland, glacial till plain bound by the Puget Sound on the west and the Cascade Mountain foothills on the east. Locally, the Subject Property is situated near Totem Lake, a ‘pothole’ type lake. The Subject Property is situated on the northern side of the lake.

4.4.2 Topography

The Subject Property is located at an elevation of approximately 120 to 140 feet above mean sea level (amsl). The subject property slopes down slightly to the south, towards Totem Lake. Totem Lake is situated in an east-west trending channel formed during the most recent Pleistocene glaciation (Earth Consultants, Inc, 1978).

Shallow groundwater flow, as well as potential soil or groundwater contaminant migration, would be expected to be generally southerly, towards the lake (See Figure 2 - Location Map, which depicts the location of the Subject Property on the Kirkland, Washington USGS 7.5 Minute Topographic Quadrangle, 2014).

4.4.3 Geologic and Soil Conditions

According to the USGS’ “Geologic Map of the Kirkland Quadrangle, Washington” (Minard, 1983) the geologic unit underlying the Subject Property are pre-glacial transitional beds. Transitional beds in the Subject Property vicinity are typically very dense/hard silts and clays that grade upward to fine sands. These deposits were placed during the interglacial period when the local environment was transitioning for a non-glacial to glacial environment. The Earth Consultants and AESI geotechnical reports interpreted site soils observed during their subsurface investigation as consisting of up to 19 feet of fill soils overlying two to four feet of peat. Dense sands were encountered below the peat.

The United States Department of Agriculture Natural Resource Conservation Service's Web Soil Survey was consulted for information relating to soils underlying the Subject Property. The survey, which typically addresses soil conditions from the ground surface to a depth of five feet, indicates the soil units underlying the Subject Property as a combination of Seattle Muck and Everett very gravelly sandy loam. Seattle Muck is described as a “very deep, very poorly drained organic soils formed in herbaceous and woody deposits in depressions in river valleys and glacial till plains. Slopes are 0 to 1 percent.” Everett
very gravelly sandy loam is formed on ice-marginal glacial deposits (kames, eskers, moraines) and is described as a very deep, somewhat excessively drained soil.

4.4.4 Hydrogeology and Hydrology

Near-surface or perched groundwater typically occurs when an underlying soil layer of less permeability prevents the downward percolation of water. Water will build up above the less permeable soil, such as glacial till, and move laterally in the more permeable overlying soils. Wet or saturated soils may also be encountered at depth due to cleaner sand and gravel zones. Groundwater conditions should be expected to fluctuate due to season, amount of precipitation, and other on-site and off-site factors.

The reviewed geologic map and soil survey indicate that transitional beds underlies the Subject Property, although the site geotechnical investigation found shallow fill and peat soils overlying the denser glacial or pre-glacial soils. Groundwater was encountered in the geotechnical borings at an approximate elevation of 120 feet MSL (8 to 20 feet bgs). The monitoring well installed by AESI had a groundwater level of 16 feet bgs at time of drilling. Groundwater levels will likely fluctuate with season, precipitation patterns, and site utilization.

Although groundwater flow direction is difficult to predict without the installation of at least three monitoring wells that measure water levels over time, an estimate of possible near-surface groundwater flow direction is provided to help evaluate potential on-site and off-site contaminant impacts. Groundwater flow direction is the path along which dissolved contaminants might migrate if present in groundwater supplies. Typically, in this region, the near-surface groundwater flow direction generally follows topography. The Subject Property slopes toward the south in the direction of Totem Lake thus potential near-surface groundwater underlying the Subject Property may be to the south. Variations in the assumed flow direction may exist that would remain uncharacterized without performing a subsurface exploration program with groundwater monitoring wells, which is beyond the Phase I scope of work.

4.4.5 Drinking Water Supplies and Water Wells

The City of Kirkland provides drinking water to the subject property through the Cascade Water Alliance (CWA). The Cascade Water Alliance (CWA) purchases its water from the City of Seattle, which obtains its drinking water supply from the Cedar River and Tolt River watersheds in southeast and northeast portions of King County, respectively. Based on the separation distances, it is highly unlikely that the
possible contamination associated with the Subject Property would directly affect these drinking water supplies.

A review of water well reports on the Washington Department of Ecology’s Well Log website did not reveal reports for drinking water wells located within approximately one-half-mile of the Subject Property.

4.5 Historical Use of the Subject Property and Adjoining Properties

Using historical aerial photographs, city directories, fire insurance maps, personal interviews and land title records, OSG attempted to assess the history of the Subject Property dating back to 1940 or first developed use. OSG identified historical vicinity records dating back to 1895, and documentation of site development dating back to 1980. The following Table 4 summarizes the historical use of the Subject Property and surrounding area.

4.5.1 Aerial Photographs

Historical aerial photographs may be used to evaluate changes in land use and to identify visible areas of potential environmental concern. A search for historical aerial photographs depicting the Subject Property and vicinity was conducted by Environmental Data Resources, Inc. (EDR). It should be noted that the scale of the available aerial photographs precludes the distinct identification of structures
and/or land uses on or in the vicinity of the Subject Property. Aerial photographs depicting the Subject Property were reviewed and are summarized below.

OSG retained Environmental Data Resources, Inc. (EDR) to provide aerial photographs of the Subject Property and immediate surrounding area. OSG additionally viewed online aerial photograph images via Google Earth. The reviewed aerial photographs and images are listed below. The EDR Aerial Photograph Decade Package is included in Appendix D.

In the review of the aerial photographs, observations are interpretative and limited to the area within approximately one-quarter-mile of the lease area. The scale of each photograph did not provide a clear image of specific site characteristics. However, we were able to discern the absence and presence of structures on the lease area, as well as developmental trends in the immediate subject area.

**1941 - 1952**

The 1941 and 1944 photographs are difficult to decipher due to clarity; however, it appears that the Subject Property is undeveloped and vacant. Totem Lake is present adjacent to the southeast. The Northern Pacific Railroad alignment is present adjacent southeast of Totem Lake. Surrounding properties appear to be primarily developed as agriculture and single-family residences. An apparent orchard is approximately 500 feet north of the Subject Property. A roughly east-west secondary road equivalent to the current Northeast 124th Street is present approximately 500 feet south of the Subject
Property. The Subject Property is partially graded and cleared in the 1952 aerial photograph. Surrounding land use is generally unchanged.

1965-1968

A 1965 and 1968 aerial photographs show that the Subject Property has mostly revegetated and remains undeveloped. Grading and clearing has occurred on the adjacent north parcels in 1965, and the parcels appear to be returned to agricultural use in 1968. A roadway along the current Interstate 405 has been constructed approximately 500 feet west of the subject property, and arterial roads to the south of the Subject Property have been improved. Apparent commercial-scale development is visible south of Northeast 124th Street in 1965 and 1968.

1973-1977

Conditions on the Subject Property appear to be similar to those depicted on the 1968 aerial photograph. The profile of Totem Lake has been modified, possibly from filling and dredging during local development activities. The adjacent north parcel has been graded and cleared, and the Totem Lake Mall development is visible in the 1973 photograph, with extension of the commercial structures in the 1977 photograph. Continued urban/commercial infilling is visible to the south and southwest of the Subject Property. The Interstate 405 alignment is improved to a four-lane highway in the 1977 photograph, with associated access road and arterial improvements.

1980, 1985 and 1990

The Subject Property is developed in its current configuration in the 1980 photograph. A commercial-scale structure is built at the east end of the Subject Property, with the remainder of the Property developed with paved parking. A commercial-scale structure is visible adjacent west of the Subject Property in the 1980 photograph, and a second commercial-scale structure is visible adjacent east of the Subject Property in the 1990 photograph. The adjacent north Totem Lake Mall area is substantially unchanged. Continued urban/commercial infilling is visible to the south and southwest of the Subject Property.

Aerial photographs dated 2006, 2009, 2013 and 2017 show the Subject Property and immediate surrounding area developed much as they appear today.

4.5.2 Sanborn Fire Insurance Maps

OSG retained EDR to conduct a search of available Sanborn Map Company fire insurance maps for the Subject Property. Sanborn maps, as they are commonly referred, typically detail building construction type and use, and may show underground and above ground storage tanks, chemical storage areas, and other recognized environmental conditions. The collection dates from 1866 and includes over 1.2 million Sanborn maps chronicling the history of approximately 12,000 American cities and towns. A search for historical fire insurance maps depicting the Subject Property and vicinity was conducted by EDR Sanborn Maps, Inc. The EDR Report indicated that coverage for the vicinity of the Subject Property was not available. The EDR Certified Sanborn Map Report is included in Appendix D.

4.5.3 Topographic Maps

Historical topographic maps provide information related to physical land configuration such as elevation, ground slope, surface water and other features. While most buildings in densely developed urban centers are not depicted, topographic maps typically show structures equal to or larger than the size of a single-family residence in rural areas. Other notable features such as woods, pipelines, municipal boundaries, and areas of filled land are often marked on topographic maps.

A search for historical topographic maps depicting the Subject Property and vicinity was conducted by Environmental Data Resources, Inc. (EDR). Historical topographic maps depicting the Subject Property were reviewed and are summarized below. Copies of the topographic maps are presented in Appendix D.

Date: 1895, Snohomish, WA

Description: No structures are depicted on the Subject Property. Secondary roads are present south of the subject property within one-quarter mile. Several small, possibly single-family residential structures are shown approximately a one-half mile south of the Subject Property along a secondary road.
Date: 1897, Snohomish, WA

Description: Conditions on the Subject Property and adjoining properties appear similar to those depicted in the 1895 map. The 1968 map depicts increased development in the surrounding area.

Date: 1950, Kirkland, WA

Description: No development is depicted on the Subject Property. Totem Lake is depicted adjacent south, with an outlet stream flowing to the west. Northern Pacific Railroad is located southeast of Totem Lake and runs in a northeast-southwest alignment at that location. Secondary roads in the Subject Property vicinity have been improved and expanded, and residential-scale structures are depicted within one-quarter mile of the Subject Property.

Date: 1968, Kirkland, WA

Description: No development is depicted on the Subject Property. Grading and development is depicted to the west of the Subject Property. Roadways in the general area have been expanded and improved, and the Interstate 405 alignment is depicted approximately 1,000 feet west of the Subject Property. Commercial-scale structures are depicted within one-half mile of the Subject Property, with increased commercial/urban development in the surrounding area.

Date: 1973, Kirkland, WA

Description: No development is depicted on the Subject Property. The profile of Totem Lake has been modified, and the outlet stream is no longer depicted. The Totem Lake Mall development is depicted as a shaded polygon. The Interstate 405 alignment has been modified, with associated access roads and improvement to arterial streets.

Date: 2014, Kirkland, WA

Description: No development is depicted on the Subject Property. The topographic map format does not depict area development types. The Burlington Northern Railroad alignment is no longer shown to the southeast of Totem Lake. Roadways in the general area have been expanded and improved.
4.5.4 Street Directories

Street directories are commercial publications containing names and addresses, and in many cases, occupations of the occupants of a particular community. The directories may also contain information pertaining to business processes conducted within a community. A search for historical street directories was conducted by Environmental Data Resources, Inc. (EDR). Historical street directories dating back to 1969 and reviewed on approximately five-year intervals are summarized below.

The Subject Property was not listed prior to 1982. From 1982 to 1992, the Subject Property was first listed as ‘Sea Galley Restaurant.’ The Subject Property was subsequently listed as the ‘Cowboy Steakhouse & Saloon’ on the 1992 through 2000 directories, and as ‘Rosarita’ in 2005. The 2010 and 2014 directories listed the Subject Property as ‘Yuppie Pawn.’ Surrounding property listings in the reviewed directories consisted primarily office/commercial listings. No commercial or industrial listings were found on the reviewed directories that would be considered to constitute a REC.

Copies of the street directories are presented in Appendix D.

4.5.5 Recorded Land Title Records

Land title records provide information on previous ownership of a property. Typically, deeds signifying transfer of a land parcel are recorded in county files and can be researched to determine the identity of past owners. A “chain of title” is a continuous record of ownership for a specific parcel. A chain of title was not provided for the Subject Property. However, a search for Environmental Liens and Activity and Use Limitations (discussed in Section 4.5.7 of this Assessment) indicated that the title of the Subject Property belongs to the City of Kirkland.

4.5.6 Property Tax Records

The property card for the Subject Property was obtained at the King County Assessor’s Office. The property card identifies the owner as of 2014 as the City of Kirkland. Assessor’s Office records indicate that the property consists of a 7,000 square foot retail building and parking. Prior ownership of the property was by ‘Rosarita, LLC.’ Copies of the property tax records are presented in Appendix E.
4.5.7 Environmental Liens and Activity and Use Limitations

A search for Environmental Liens and Activity and Use Limitations of the Subject Property was conducted by EDR; none were found. A copy of the Environmental Lien and Activity and Use Limitations report is presented in Appendix F.

4.5.8 Previous Environmental Reports

OSG was not provided with or made aware of previous environmental assessments or other documentation regarding environmental investigations performed for the Subject Property. OSG did not identify previous environmental reports for the Subject Property at local agencies or other sources contacted during this assessment.

4.5.9 Other Historical Records and Interviews

The User Questionnaire was sent to the City, but not returned at the time of this printing.
5.0 SUBJECT PROPERTY RECONNAISSANCE

5.1 On-Site Inspection Observations

Vance Atkins of OSG conducted a reconnaissance of the Subject Property on November 14, 2018. The purpose of the site reconnaissance was to evaluate current conditions on the Subject Property to look for recognized, controlled, and historic environmental conditions. The weather was mostly sunny and in the mid 50°s. Site visit photographs are included in Appendix G.

Table 5 summarizes OSG’s observations of the Subject Property and project site. A discussion of the observed environmental concerns follows Table 5.

<table>

</tbody>
</table>
General Observations

The Property is currently developed with an approximately 7,000 square foot wood frame commercial building located at the eastern end of the parcel. The majority of the remainder of the Subject Property is occupied by paved parking and landscaped areas. The property is currently used as office space and occupied by construction management and engineering personnel associated with property redevelopment north of Totem Lake Way. A temporary office trailer is located south of the commercial building.

5.2 Adjacent Site and Vicinity Observations

Vance Atkins of OSG conducted a reconnaissance of the area surrounding the Subject Property on November 14, 2018. The purpose of this reconnaissance was to observe land use in the Subject Property vicinity and to evaluate the potential for nearby businesses or facilities to generate, use, or store hazardous substances that may affect the Subject Property. The off-site reconnaissance was generally non-intrusive with the adjoining properties observed from the Subject Property and public rights-of-way.

The adjoining properties are developed as noted in Section 3.5. OSG did not observe readily apparent recognized environmental conditions on parcels immediately adjoining the Subject Property, that in OSG’s opinion, may adversely environmentally affect the Subject Property.

5.3 Methodology and Limiting Conditions

The Subject Property reconnaissance consisted of visual and/or physical observations of the Subject Property, adjoining properties as viewed from the Subject Property boundaries, and the surrounding area based on visual observations made from adjacent public thoroughfares. At the time of the survey, the weather was clear and approximately 50º Fahrenheit.

5.4 Hazardous Substances and Petroleum Products

5.4.1 Hazardous Substances and Petroleum Products

OSG did not observe staining, discoloration, odors, or other readily apparent indications of a hazardous substance or petroleum release in these areas. Hazardous material use and storage at the Subject Property was limited to small quantities of fuel and maintenance materials used for fueling construction equipment (power tools and off-road 4-wheelers). Fuel was stored in containers of less than five gallons.
capacity and most hazardous materials were stored in a secure flammables cabinet. Housekeeping around other portions of the Subject Property appeared good and OSG did not observe readily apparent indications of hazardous substance or petroleum releases on the Subject Property.

5.4.2 Unidentified Substances Containers

OSG did not observe evidence of unidentified substances containers at the Subject Property.

5.5 Waste Generation, Storage, and Disposal

Non-regulated solid waste was not found improperly disposed of at the Subject Property. Commercial containers for solid waste and recycling were observed to the west of the Subject Property building.

5.6 Underground Storage Tanks (USTs) & Aboveground Storage Tanks (ASTs)

5.6.1 Existing Storage Tanks

OSG identified no evidence of current USTs or ASTs located at the Subject Property.

5.6.2 Former Storage Tanks

Based upon site reconnaissance, interviews, and a review of state and local records, OSG identified no evidence of former USTs or ASTs located at the Subject Property.

5.7 Oil-Containing Equipment and Polychlorinated Biphenyls (PCBs)

OSG did not observe any oil-containing equipment or evidence of PCBs at the Subject Property. Electrical service for the Property originates from underground power lines along Totem Lake Way. No transformers were observed. Based on these observations, it is unlikely that possible PCBs associated with the transformers have adversely environmentally affected the project site.

5.8 Monitoring Wells

A monitoring well cover was observed at the western portion of the Subject Property. Based on discussions with AESI personnel, the well was one of two installed as part of their 2017 geotechnical investigation. The well was not associated with groundwater quality monitoring or other uses.
5.9 Lead-Based Paint and Asbestos-Containing Building Materials

Lead-based paint and Asbestos-Containing Building Material (ACBM) surveys are not part of the Phase I ESA scope of work.
6.0 INTERVIEWS

The City of Kirkland identified Brian Baker, as a contact knowledgeable of the Subject Property history and development. The User Questionnaire was forwarded to City of Kirkland. The User Questionnaire and any accompanying documentation is presented in Appendix B.

<table>
<thead>
<tr>
<th>Contact / Affiliation</th>
<th>Date of Communication</th>
<th>Years Associated with Subject Property</th>
<th>Telephone No.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Brian Baker, City of Kirkland</td>
<td>8/23/17</td>
<td>7</td>
<td>206-617-2119</td>
</tr>
</tbody>
</table>

Brian Baker of the City of Kirkland, the current Property owner, was interviewed on November 19, 2018. The City has owned the Property since February, 2014, and purchased it from the prior owner, Rosarita, LLC. The property was developed as a restaurant at that time. Mr. Baker was not aware of any hazardous materials use or releases at the Property. He did not report any USTs or ASTs currently or formerly in use at the Property. The residence was on public electricity, water, natural gas, and sanitary sewer. He reported that some filling and ground improvement had occurred at the Subject Property, based, in part, on geotechnical report recommendations prior to its development in 1979, and provided a copy of the geotechnical report for review (discussed in Section 3.3). No dumping or waste disposal had occurred at the Property.
7.0 CONDITIONS OUTSIDE THE SCOPE OF ASTM PRACTICE E 1527-13

The following sections address environmental issues or conditions at the Subject Property that parties may wish to assess in connection with commercial real estate that are outside the scope of ASTM Practice E 1527-13 (non-scope considerations).

7.1 Asbestos-Containing Material (ACM)

Asbestos is a term used to describe a group of six naturally occurring crystalline fiber minerals. Asbestos has excellent thermal stability, a high degree of tensile strength, and has been used extensively in the textile, insulation, and building industries, particularly as a component in fireproofing, decorative coatings, insulation materials, and as reinforcement for plaster binders in building products. Asbestos-containing building materials are generally classified as friable or non-friable. Friable materials are those which can be crumbled, pulverized, or reduced to powder by hand pressure, or by normal use or maintenance can be expected to emit asbestos fibers into the air. Non-friable ACM is a potential concern if it is damaged by maintenance work, demolition, or other activities, at which time it may be considered friable.

7.2 Lead-Based Paint (LBP)

Use of lead in household paint was banned by the U.S. Environmental Protection Agency (EPA) effective January 1, 1978. The EPA and the U.S. Department of Housing and Urban Development (HUD) consider lead-based paint as containing a lead concentration equal to or greater than 1.0 milligram per square centimeter (mg/cm²) or 0.5% lead by weight, as defined by Title X of the 1992 Housing and Community Development Act.

Based on the construction date of the structure (1979), it was built as these products were phased out for construction use (1977 and 1978, respectively), although some remnant stock of these products was still utilized past that date. Med-Tox Northwest, a hazardous building materials consultant, conducted a survey and sampling of the building. Their report will be provided under separate cover.
8.0 LIMITED PHASE II ESA

Although treated wood piles do not typically meet the definition of a REC, OSG was requested to conduct an investigation to confirm the presence of piles, and assess soil conditions, if accessible.

8.1 Soil Sampling

On November 19, 2018, OSG was on site with AESI during their limited geotechnical investigation at the building structure. The purpose of the geotechnical investigation was to assess the presence of piles or other foundation structures at the building. OSG conducted soil sampling at the time of the investigation to assess soil impacts that may be associated with treated wood piles or filling. See Figure 2 for sampling locations.

8.1.1 Soil Sample Collection Methods

AESI’s contractor excavated a test pit/trench along the southwestern side of the building to expose the building foundation.

Soil samples from the borings were collected from the excavation or from the excavator bucket. Each soil sample was logged by an OSG geologist for physical properties such as grain size, color, and moisture. After sample collection, a portion was placed into pre-cleaned laboratory prepared glass jars and vials with Teflon lids.

All samples were immediately placed into ice-filled coolers and delivered to Fremont Environmental Laboratory in Seattle, Washington under standard chain-of-custody procedures.

8.1.2 Analytical Methods

OSG collected selected soil samples for analysis by Fremont Analytical, a Washington Department of Ecology-accredited analytical laboratory for:

- Diesel and heavy oil-range petroleum hydrocarbons by Washington Method NWTPH-Dx
- Polyaromatic hydrocarbons by EPA Method 8270
- MTCA 5 metals (arsenic, cadmium, chromium, lead, mercury) be EPA Method 6020/7471

Analyses were performed in accordance with Fremont’s in-house Quality Assurance/Quality Control Plans. Sample analyses were performed in compliance with EPA analytical methods and Ecology
guidelines. Samples were analyzed within specified holding times. Detection limits were within method requirements and no factors appeared to adversely affect data quality.

8.2 Results

8.2.1 Field Observations and Screening

Approximately four feet of sandy fill soils were observed, and one treated wood pile was exposed. A second pile was identified by probing under the building footprint, but not exposed. Native soils (silt with sand and peat) were encountered at approximately four feet. OSG collected one soil sample from fill soils adjacent to the pile (TP-1-2) and two samples from native soils adjacent to the pile and building footprint (TP-1-4 and TP-1-5). See Figure 2 for soil sample locations.

Soil samples were field screened for indications of petroleum contamination including strong petroleum related odors. No positive indications of contamination were encountered during field screening.

8.2.2 Analytical Results

Soil sample results are summarized in Table 7. The full analytical report is included in Appendix J.

Oil range petroleum and carcinogenic PAHs were detected in the shallow fill soil sample (TP-1-2). Carcinogenic PAH concentrations exceeded the MTCA Method A Cleanup level in that sample. Other PAHs were detected but did not exceed cleanup levels. Metals were detected, but within concentrations typical of local background conditions. Significant detections of petroleum, PAHs, or metals were not detected in the two native soil samples.
9.0 FINDINGS AND OPINIONS

OSG has performed this Phase I ESA of the Subject Property in conformance with the scope and limitations of ASTM Standard E 1527-13. Any exceptions to, or deletions from, this practice are described in Section 1.0 of this report. Based upon the aforementioned research, this assessment did not identify recognized environmental conditions (RECs) in connection with the Subject Property.

However, the presence of treated wood piles underlying the were of concern for potential impacts to fill soils that may require excavation as part of the property redevelopment. OSG collected representative samples at the building footprint as part of a geotechnical investigation of the existing building foundation and support.

cPAHs were identified in shallow fill soils adjacent to the treated wood piles. If the fill soils underlying the building footprint require disturbance as part of construction or ground improvement, they should be further characterized and profiled for off-site disposal at a licensed facility. If the piles are to be removed or cut off, they may be handled and disposed in accordance with the Departments of Ecology’s guidance for treated wood (attached as Appendix K).
10.0 RECOMMENDATIONS

Based upon the findings of this investigation, OSG recommends that:

- cPAHs were identified in shallow fill soils adjacent to the treated wood piles. If the fill soils underlying the building footprint require disturbance as part of construction or ground improvement, they should be further characterized and profiled for off-site disposal at a licensed facility. If the piles are to be removed or cut off, they may be handled and disposed in accordance with the Departments of Ecology’s guidance for treated wood.

X3. USER QUESTIONNAIRE

INTRODUCTION

In order to qualify for one of the Landowner Liability Protections (LLPs)\(^{187}\) offered by the Small Business Liability Relief and Brownfields Revitalization Act of 2001 (the “Brownfields Amendments”),\(^{188}\) the user must conduct the following inquiries required by 40 CFR 312.25, 312.28, 312.29, 312.30, and 312.31. These inquiries must also be conducted by EPA Brownfield Assessment and Characterization grantees. The user should provide the following information to the environmental professional. Failure to conduct these inquiries could result in a determination that “all appropriate inquiries” is not complete.

(1.) Environmental liens that are filed or recorded against the property (40 CFR 312.25).

Did a search of recorded land title records (or judicial records where appropriate, see Note 1 below) identify any environmental liens filed or recorded against the property under federal, tribal, state or local law?

<table>
<thead>
<tr>
<th>Environmental Liens</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Known</strong></td>
</tr>
<tr>
<td><strong>Unknown</strong></td>
</tr>
</tbody>
</table>

**Note 1**—In certain jurisdictions, federal, tribal, state, or local statutes, or regulations specify that environmental liens and AULs be filed in judicial records rather than in land title records. In such cases judicial records must be searched for environmental liens and AULs.

(2.) Activity and use limitations that are in place on the property or that have been filed or recorded against the property (40 CFR 312.25(a)(1)(v) and vii)).

Did a search of recorded land title records (or judicial records where appropriate, see Note 1 above) identify any AULs, such as engineering controls, land use restrictions or institutional controls that are in place at the property and/or have been filed or recorded against the property under federal, tribal, state or local law?

<table>
<thead>
<tr>
<th>Activity and Use Limitations</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Known</strong></td>
</tr>
<tr>
<td><strong>Unknown</strong></td>
</tr>
</tbody>
</table>

(3.) Specialized knowledge or experience of the person seeking to qualify for the LLP (40 CFR 312.28).

Do you have any specialized knowledge or experience related to the property or nearby properties? For example, are you involved in the same line of business as the current or former occupants of the property or an adjoining property so that you would have specialized knowledge of the chemicals and processes used by this type of business?

I have no prior knowledge of this property or if any chemicals were used on this site.

(4.) Relationship of the purchase price to the fair market value of the property if it were not contaminated (40 CFR 312.29).

Does the purchase price being paid for this property reasonably reflect the fair market value of the property? If you conclude that there is a difference, have you considered whether the lower purchase price is because contamination is known or believed to be present at the property?

The City paid fair market value and no known contamination existed on site at that time or currently.

(5.) Commonly known or reasonably ascertainable information about the property (40 CFR 312.30).

Are you aware of commonly known or reasonably ascertainable information about the property that would help the environmental professional to identify conditions indicative of releases or threatened releases? For example, (a) Do you know the past uses of the property?

<table>
<thead>
<tr>
<th>Office space, restaurant</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Known</strong></td>
</tr>
<tr>
<td><strong>Unknown</strong></td>
</tr>
</tbody>
</table>

(6.) The degree of obviousness of the presence or likely presence of contamination at the property, and the ability to detect the contamination by appropriate investigation (40 CFR 312.31).

Based on your knowledge and experience related to the property are there any obvious indicators that point to the presence or likely presence of releases at the property?

I have no documentation supporting the presence of contamination on this property.

---

\(^{187}\) **Landowner Liability Protections**, or **LLPs**, is the term used to describe the three types of potential defenses to Superfund liability in EPA's *Interim Guidance Regarding Criteria Landowners Must Meet in Order to Qualify for Bonafide Prospective Purchaser, Contiguous Property Owner, or Innocent Landowner Limitations on CERCLA Liability* ("Common Elements" Guide) issued on March 6, 2003.

\(^{188}\) P.L. 107-118.

---

X3.1 In addition, certain information should be collected, if available, and provided to the environmental professional conducting the Phase I Environmental Site Assessment. This information is intended to assist the environmental professional, but is not necessarily required to qualify for one of the LLPs. The information includes:

- (a) the reason why the Phase I is being performed,
- (b) the type of property and type of property transaction, for example, sale, purchase, exchange, etc.,
- (c) the complete and correct address for the property (a map or other documentation showing property location and boundaries is helpful),

ANY LIABILITY ON THE PART OF ENVIRONMENTAL DATA RESOURCES, INC. IS STRICTLY LIMITED TO A REFUND OF THE AMOUNT PAID FOR THIS REPORT. Purchaser accepts this Report "AS IS". Any analyses, estimates, ratings, environmental risk levels or risk codes provided in this Report are provided for illustrative purposes only, and are not intended to provide, nor should they be interpreted as providing any facts regarding, or prediction or forecast of, any environmental risk for any property. Only a Phase I Environmental Site Assessment performed by an environmental professional can provide information regarding the environmental risk for any property. Additionally, the information provided in this Report is not to be construed as legal advice.

Copyright 2018 by Environmental Data Resources, Inc. All rights reserved. Reproduction in any media or format, in whole or in part, of any report or map of Environmental Data Resources, Inc., or its affiliates, is prohibited without prior written permission.

EDR and its logos (including Sanborn and Sanborn Map) are trademarks of Environmental Data Resources, Inc. or its affiliates. All other trademarks used herein are the property of their respective owners.
A search of available environmental records was conducted by Environmental Data Resources, Inc (EDR). The report was designed to assist parties seeking to meet the search requirements of EPA’s Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E 1527-13), the ASTM Standard Practice for Environmental Site Assessments for Forestland or Rural Property (E 2247-16), the ASTM Standard Practice for Limited Environmental Due Diligence: Transaction Screen Process (E 1528-14) or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

TARGET PROPERTY INFORMATION

ADDRESS

12031 NE TOTEM LAKE WAY
KIRKLAND, WA 98034

COORDINATES

Latitude (North): 47.7117510 - 47° 42' 42.30"
Longitude (West): 122.1779200 - 122° 10' 40.51"
Universal Tranverse Mercator: Zone 10
UTM X (Meters): 561666.0
UTM Y (Meters): 5284372.0
Elevation: 134 ft. above sea level

EXECUTIVE SUMMARY

TARGET PROPERTY SEARCH RESULTS

The target property was not listed in any of the databases searched by EDR.

DATABASES WITH NO MAPPED SITES

No mapped sites were found in EDR’s search of available ("reasonably ascertainable ") government records either on the target property or within the search radius around the target property for the following databases:

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified in the following databases.

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property.

Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in bold italics are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.
STANDARD ENVIRONMENTAL RECORDS

Federal RCRA generators list

RCRA-SQG: RCRAInfo is EPA’s comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month.

A review of the RCRA-SQG list, as provided by EDR, and dated 03/01/2018 has revealed that there is 1 RCRA-SQG site within approximately 0.25 miles of the target property.

RCRA-CESQG: RCRAInfo is EPA’s comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Conditionally exempt small quantity generators (CESQGs) generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month.

A review of the RCRA-CESQG list, as provided by EDR, and dated 03/01/2018 has revealed that there are 3 RCRA-CESQG sites within approximately 0.25 miles of the target property.

EXECUTIVE SUMMARY

State- and tribal - equivalent CERCLIS

WA CSCSL: The State Hazardous Waste Sites records are the states’ equivalent to CERCLIS. These sites may or may not already be listed on the federal CERCLIS list. Priority sites planned for cleanup using state funds (state equivalent of Superfund) are identified along with sites where cleanup will be paid for by potentially responsible parties. The data come from the Department of Ecology’s Confirmed & Suspected Contaminated Sites List.

A review of the WA CSCSL list, as provided by EDR, and dated 07/16/2018 has revealed that there are 12 WA CSCSL sites within approximately 1 mile of the target property.

State and tribal landfill and/or solid waste disposal site lists

WA SWF/LF: The Solid Waste Facilities/Landfill Sites records typically contain an inventory of solid waste disposal facilities or landfills in a particular state. The data come from the Department of Ecology’s Solid Waste Facilities Handbook.

A review of the WA SWF/LF list, as provided by EDR, has revealed that there is 1 WA SWF/LF site within approximately 0.5 miles of the target property.

**State and tribal leaking storage tank lists**

WA LUST: The Leaking Underground Storage Tank Incident Reports contain an inventory of reported leaking underground storage tank incidents. The data come from the Department of Ecology’s Leaking Underground Storage Tanks Site List.

A review of the WA LUST list, as provided by EDR, has revealed that there are 6 WA LUST sites within approximately 0.5 miles of the target property.

WA CSCSCL NFA: The data set contains information about sites previously on the Confirmed and Suspected Contaminated Sites list that have received a No Further Action (NFA) determination. Because it is necessary to maintain historical records of sites that have been investigated and cleaned up, sites are not deleted from the database when cleanup activities are completed. Instead a No Further Action code is entered based upon the type of NFA determination the site received.

A review of the WA CSCSCL NFA list, as provided by EDR, and dated 07/16/2018 has revealed that there
are 7 WA CSCSL NFA sites within approximately 0.5 miles of the target property.

**Other Ascertainable Records**

RCRA NonGen / NLR: RCRAInfo is EPA’s comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Non-Generators do not presently generate hazardous waste.

A review of the RCRA NonGen / NLR list, as provided by EDR, and dated 03/01/2018 has revealed that there are 8 RCRA NonGen / NLR sites within approximately 0.25 miles of the target property.

**EDR HIGH RISK HISTORICAL RECORDS**

**EDR Exclusive Records**
EDR Hist Auto: EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR’s review was limited to those categories of sources that might, in EDR’s opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as “High Risk Historical Records”, or HRHR. EDR’s HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

A review of the EDR Hist Auto list, as provided by EDR, has revealed that there is 1 EDR Hist Auto site within approximately 0.125 miles of the target property.

EDR Hist Cleaner: EDR has searched selected national collections of business directories and has collected listings of potential dry cleaner sites that were available to EDR researchers. EDR’s review was limited to those categories of sources that might, in EDR’s opinion, include dry cleaning establishments. The categories reviewed included, but were not limited to cleaners, cleaners, laundry, laundromat, cleaning/laundry, wash & dry etc. This database falls within a category of information EDR classifies as “High Risk Historical Records”, or HRHR. EDR’s HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

A review of the EDR Hist Cleaner list, as provided by EDR, has revealed that there are 3 EDR Hist Cleaner sites within approximately 0.125 miles of the target property.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

TOTEM LAKE CHEVRON 91144 (Continued)

Capacity Range: 5,000 to 9,999 Gallons
Tank Permit Expiration Date: 09/30/2015
Tank Upgrade Date: 02/02/1998
Tank Spill Prevention: Spill Bucket/Spill Box
Tank Overfill Prevention: Automatic Shutoff (fill pipe)
Tank Material: Fiberglass Reinforced Plastic
Tank Construction: Double Wall Tank
Tank Tightness Test: Not reported
Tank Corrosion Protection: Corrosion Resistant
Tank Manifold: Not reported
Tank Release Detection: Intersitial Monitoring
Tank SFC Type: Not reported
Pipe Material: Fiberglass
Pipe Construction: Single Wall Pipe
Pipe Primary Release Detection: Automatic Line Leak Detector (ALLD)
Pipe Second Release Detection: Annual Line Tightness Test (LTT)
Pipe Corrosion Protection: Corrosion Resistant
Pipe Pumping System: Pressurized System
Responsible Unit: NORTHWEST
Dispenser/Pump SFC Type: Not reported

Tank Name: 5
Tag Number: A0706, A5661
Tank Status: Removed
Tank Status Date: 08/06/1996
Tank Install Date: 00/31/1964
Tank Closure Date: Not reported
Capacity Range: 111 TO 1,100 Gallons
Tank Permit Expiration Date: Not reported
Tank Upgrade Date: Not reported
Tank Spill Prevention: Not reported
Tank Overfill Prevention: Not reported
Tank Material: Steel
Tank Construction: Single Wall Tank
Tank Tightness Test: Not reported
Tank Corrosion Protection: Not reported
Tank Manifold: Not reported

#### Handler Activities Summary:
- U.S. importer of hazardous waste: No
- Mixed waste (haz. and radioactive): No
- Recycler of hazardous waste: No
- Transporter of hazardous waste: No
- Treater, storor or disposer of HW: No
- Underground injection activity: No
- On-site burner exemption: No
- Furnace exemption: No
- Used oil fuel burner: No
- Used oil processor: No
- User oil refiner: No
- Used oil fuel marketer to burner: No
- Used oil Specification marketer: No
- Used oil transfer facility: No
- Used oil transporter: No

#### Waste Information:
- **Waste code:** D001
- **Waste name:** IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

- **Waste code:** D018
- **Waste name:** BENZENE

#### Historical Generators:
- **Date form received by agency:** 02/07/2014

FINDS:

Registry ID: 110005363221

Environmental Interest/Information System
Washington Facility / Site Identification System (WA-FSIS) provides a means to query and display data maintained by the Washington Department of Ecology. This system contains key information for each facility/site that is currently, or has been, of interest to the Air Quality, Dam Safety, Hazardous Waste, Toxics Cleanup, and Water Quality Programs.
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Handler Activities Summary:
U.S. importer of hazardous waste: No
Mixed waste (haz. and radioactive): No
Recycler of hazardous waste: No
Transporter of hazardous waste: No
Treater, storer or disposer of HW: No
Underground injection activity: No
On-site burner exemption: No
Furnace exemption: No
Used oil fuel burner: No
Used oil processor: No
User oil refiner: No
Used oil fuel marketer to burner: No
Used oil Specification marketer: No
Used oil transfer facility: No
Used oil transporter: No

Historical Generators:
Date form received by agency: 12/31/2003

Environmental Interest/Information System
Washington Facility / Site Identification System (WA-FSIS) provides a
means to query and display data maintained by the Washington
Department of Ecology. This system contains key information for each
facility/site that is currently, or has been, of interest to the Air
Quality, Dam Safety, Hazardous Waste, Toxics Cleanup, and Water
Quality Programs.

RCRAInfo is a national information system that supports the Resource
Conservation and Recovery Act (RCRA) program through the tracking of

Handler Activities Summary:
U.S. importer of hazardous waste: No
Mixed waste (haz. and radioactive): No
Recycler of hazardous waste: No
Transporter of hazardous waste: No
Treater, storer or disposer of HW: No
Underground injection activity: No
On-site burner exemption: No
Furnace exemption: No
Used oil fuel burner: No
Used oil processor: No
User oil refiner: No
Used oil fuel marketer to burner: No
Used oil Specification marketer: No
IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

A WASTE WHICH HAS A PH OF LESS THAN 2 OR GREATER THAN 12.5 IS CONSIDERED TO BE A CORROSIVE HAZARDOUS WASTE. SODIUM HYDROXIDE, A CAUSTIC SOLUTION WITH A HIGH PH, IS OFTEN USED BY INDUSTRIES TO CLEAN OR DEGREASE PARTS. HYDROCHLORIC ACID, A SOLUTION WITH A LOW PH, IS USED BY MANY INDUSTRIES TO CLEAN METAL PARTS PRIOR TO PAINTING. WHEN THESE CAUSTIC OR ACID SOLUTIONS BECOME CONTAMINATED AND MUST BE DISPOSED, THE WASTE WOULD BE A CORROSIVE HAZARDOUS WASTE.

**FINDS:**

| Registry ID: 110005372961 |

**Environmental Interest/Information System**

Washington Facility / Site Identification System (WA-FSIS) provides a means to query and display data maintained by the Washington Department of Ecology. This system contains key information for each facility/site that is currently, or has been, of interest to the Air Quality, Dam Safety, Hazardous Waste, Toxics Cleanup, and Water Quality Programs.

**RCRAInfo** is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

**Handler Activities Summary:**

**U.S. importer of hazardous waste:** No
EVERGREEN HOSPITAL MEDICAL CTR  (Continued) 1004793242

Mixed waste (haz. and radioactive): No
Recycler of hazardous waste: No
Transporter of hazardous waste: No
Treater, storer or disposer of HW: No
Underground injection activity: No
On-site burner exemption: No
Furnace exemption: No
Used oil fuel burner: No
Used oil processor: No
User oil refiner: No
Used oil fuel marketer to burner: No
Used oil Specification marketer: No
Used oil transfer facility: No
Used oil transporter: No

- Waste code: D001
- Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

Environmental Interest/Information System
Washington Facility / Site Identification System (WA-FSIS) provides a means to query and display data maintained by the Washington Department of Ecology. This system contains key information for each facility/site that is currently, or has been, of interest to the Air Quality, Dam Safety, Hazardous Waste, Toxics Cleanup, and Water Quality Programs.

AFS (Aerometric Information Retrieval System (AIRS) Facility Subsystem) replaces the former Compliance Data System (CDS), the National Emission Data System (NEDS), and the Storage and Retrieval of Aerometric Data (SAROAD). AIRS is the national repository for information concerning airborne pollution in the United States. AFS is used to track emissions and compliance data from industrial plants. AFS data are utilized by states to prepare State Implementation Plans to comply with regulatory programs and by EPA as an input for the estimation of total national emissions. AFS is undergoing a major redesign to support facility operating permits required under Title V of the Clean Air Act.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

HAZARDOUS WASTE BIENNIAL REPORTER

AIR MINOR

ICIS (Integrated Compliance Information System) is the Integrated Compliance Information System and provides a database that, when complete, will contain integrated Enforcement and Compliance information across most of EPA's programs. The vision for ICIS is to replace EPA's independent databases that contain Enforcement data with a single repository for that information. Currently, ICIS contains all Federal Administrative and Judicial enforcement actions. This information is maintained in ICIS by EPA in the Regional offices and it Headquarters. A future release of ICIS will replace the Permit Compliance System (PCS) which supports the NPDES and will integrate
EVERGREEN HOSPITAL MEDICAL CTR (Continued)  

that information with Federal actions already in the system. ICIS also
has the capability to track other activities occurring in the Region
that support Compliance and Enforcement programs. These include;
Incident Tracking, Compliance Assistance, and Compliance Monitoring.

<tr>
<td>77233621</td>
<td>2015</td>
<td>This waste stream is generated from the use of a two-part product, Part A and Part B, which are mixed in the disinfection machine. Part A is acidic, but when mixed with Part B, a buffer, and used for its intended purpose, yields a waste effluent with a pH near neutral. Studies done onsite show that about half the cycles generate a waste that has an acceptable pH (6.7 or 6.8) and about half the cycles generate a waste that has an unacceptable pH (4.7-4.1)</td>

EVERGREEN HOSPITAL MEDICAL CTR (Continued)  1004793242

Data Year:  2014  
Comments:  SOURCE - LAB  
Facility ID:  77233621  
Data Year:  2015  
Comments:  A-7: mercury debries disposal - outdated equipment  
Facility ID:  77233621  
Data Year:  2015  
Comments:  A-6: Spill clean-up material  
Facility ID:  77233621  
Data Year:  2015  
Comments:  Most waste formalin is evidently neutralized by Pathology staff and discharged to the sanitary sewer.  
Facility ID:  77233621  
Data Year:  2015  
Comments:  Waste formalin is occasionally recycled by Pathology staff when it meets certain quality criteria. The formalin is reused to preserve specimens.  
Facility ID:  77233621  
Data Year:  2015  
Comments:  Out of spec or outdated chemicals from Lab  
Facility ID:  77233621  
Data Year:  2015  
Comments:  SOURCE - LAB  
Facility ID:  77233621  
Data Year:  2015  
Comments:  Part A is acidic, but when mixed with Part B, a buffer, and used for its intended purpose, yields a waste effluent with a pH near neutral. Studies done onsite show that about half the cycles generate a waste that has an acceptable pH (6.7 or 6.8) and about half the cycles generate a waste that has an unacceptable pH (4.7-4.1)  
Facility ID:  77233621  
Data Year:  2015  
Comments:  This waste stream is generated from two tabletop Medivator machines. The product is a one-part disinfectant containing 2.5% glutaraldehyde. King County allows waste up to 4% glutaraldehyde to be discharged without pretreatment because it is readily decomposed in wastewater treatment plants. However, waste containing glutaraldehyde designates as a Category C toxic waste in Washington.  
Facility ID:  77233621  
Data Year:  2015  
Comments:  This product was used in CPC (subsequently discontinued) to disinfect endoscopes.

<td>2015</td>
<td>SOURCE - LAB</td>
</tr>
<tr>
<td>77233621</td>
<td>2015</td>
<td>This waste stream is generated from the use of a two-part product, Part A and Part B, which are mixed in the disinfection machine. Part A is acidic, but when mixed with Part B, a buffer, and used for its intended purpose, yields a waste effluent with a pH near neutral. Studies done onsite show that about half the cycles generate a waste that has an acceptable pH (6.7 or 6.8) and about half the cycles generate a waste that has an unacceptable pH (4.7-4.1).</td>
</tr>
<tr>
<td>77233621</td>
<td>2015</td>
<td>This waste stream is generated from two tabletop Medivator machines. The product is a one-part disinfectant containing 2.5% glutaraldehyde. King County allows waste up to 4% glutaraldehyde to be discharged without pretreatment because it is readily decomposed in wastewater treatment plants. However, waste containing glutaraldehyde designates as a Category C toxic waste in Washington.</td>

Data Year: 2014
Comments: SOURCE - LAB

Facility ID: 77233621
Data Year: 2014
Comments: SOURCE - LAB

Facility ID: 77233621
Data Year: 2015
Comments: A- & Spill clean-up material

Facility ID: 77233621
Data Year: 2015
Comments: spill clean-up debries.

Facility ID: 77233621
Data Year: 2015
Comments: A-7: mercury debries disposal - outdated equipment

Facility ID: 77233621
Data Year: 2015
Comments: Out of spec or outdated chemicals from Lab

Facility ID: 77233621
Data Year: 2015
Comments: Most waste formalin is evidently neutralized by Pathology staff and discharged to the sanitary sewer.

Facility ID: 77233621
Data Year: 2015
Comments: Waste formalin is occasionally recycled by Pathology staff when it meets certain quality criteria. The formalin is reused to preserve specimens.

Facility ID: 77233621
Data Year: 2015
Comments: SOURCE - LAB

Facility ID: 77233621
Data Year: 2015
Comments: This waste stream is generated from the use of a two-part product, Part A and Part B, which are mixed in the disinfection machine. Part A is acidic, but when mixed with Part B, a buffer, and used for its intended purpose, yields a waste effluent with a pH near neutral. Studies done onsite show that about half the cycles generate a waste that has an acceptable pH (6.7 or 6.8) and about half the cycles generate a waste that has an unacceptable pH (4.7-4.1)

Facility ID: 77233621
Data Year: 2015
Comments: This waste stream is generated from two tabletop Medivator machines. The product is a one-part disinfectant containing 2.5% glutaraldehyde.
EVERGREEN HOSPITAL MEDICAL CTR  (Continued)  1004793242

King County allows waste up to 4% glutaraldehyde to be discharged without pretreatment because it is readily decomposed in wastewater treatment plants. However, waste containing glutaraldehyde designates as a Category C toxic waste in Washington.

Facility ID: 77233621
Data Year: 2015
Comments: This product was used in CPC (subsequently discontinued) to disinfect endoscopes.

Facility ID: 77233621
Data Year: 2016
Comments: A-7: Disposal of mercury filled Blood Pressure cuff no longer used

Facility ID: 77233621
Data Year: 2016
Comments: A-7: Outdated chemical from Laboratory

Facility ID: 77233621
Data Year: 2016
Comments: Most waste formalin is evidently neutralized by Pathology staff and discharged to the sanitary sewer.

Facility ID: 77233621
Data Year: 2016
Comments: Waste formalin is occasionally recycled by Pathology staff when it meets certain quality criteria. The formalin is reused to preserve specimens.

Facility ID: 77233621
Data Year: 2015
Comments: Out of spec or outdated chemicals from Lab

Facility ID: 77233621
Data Year: 2015
Comments: Most waste formalin is evidently neutralized by Pathology staff and discharged to the sanitary sewer.

Facility ID: 77233621
Data Year: 2015
Comments: Waste formalin is occasionally recycled by Pathology staff when it meets certain quality criteria. The formalin is reused to preserve specimens.

Facility ID: 77233621
Data Year: 2015
Comments: SOURCE - LAB

Facility ID: 77233621
Data Year: 2015
Comments: This waste stream is generated from the use of a two-part product, Part A and Part B, which are mixed in the disinfection machine. Part A is acidic, but when mixed with Part B, a buffer, and used for its intended purpose, yields a waste effluent with a pH near neutral. Studies done onsite show that about half the cycles generate a waste that has an acceptable pH (6.7 or 6.8) and about half the cycles generate a waste that has an unacceptable pH (4.7-4.1)

Facility ID: 77233621
Data Year: 2015
Comments: This waste stream is generated from two tabletop Medivator machines. The product is a one-part disinfectant containing 2.5% glutaraldehyde. King County allows waste up to 4% glutaraldehyde to be discharged without pretreatment because it is readily decomposed in wastewater treatment plants. However, waste containing glutaraldehyde designates as a Category C toxic waste in Washington.

Facility ID: 77233621
Data Year: 2015
Comments: This product was used in CPC (subsequently discontinued) to disinfect endoscopes.

Facility ID: 77233621
Data Year: 2016
Comments: A-7: Disposal of mercury filled Blood Pressure cuff no longer used

Facility ID: 77233621

<td>This waste stream is generated from the use of a two-part product, Part A and Part B, which are mixed in the disinfection machine. Part A is acidic, but when mixed with Part B, a buffer, and used for its intended purpose, yields a waste effluent with a pH near neutral. Studies done onsite show that about half the cycles generate a waste that has an acceptable pH (6.7 or 6.8) and about half the cycles generate a waste that has an unacceptable pH (4.7-4.1)</td>
</tr>
<tr>
<td>77233621</td>
<td>2015</td>
<td>This waste stream is generated from two tabletop Medivator machines. The product is a one-part disinfectant containing 2.5% glutaraldehyde. King County allows waste up to 4% glutaraldehyde to be discharged without pretreatment because it is readily decomposed in wastewater treatment plants. However, waste containing glutaraldehyde designates as a Category C toxic waste in Washington.</td>

- Facility ID: 77233621, Data Year: 2014, Comments: SOURCE - LAB
- Facility ID: 77233621, Data Year: 2015, Comments: A-7: mercury debries disposal - outdated equipment
- Facility ID: 77233621, Data Year: 2015, Comments: Out of spec or outdated chemicals from Lab
- Facility ID: 77233621, Data Year: 2015, Comments: Most waste formalin is evidently neutralized by Pathology staff and discharged to the sanitary sewer.
- Facility ID: 77233621, Data Year: 2015, Comments: Waste formalin is occasionally recycled by Pathology staff when it meets certain quality criteria. The formalin is reused to preserve specimens.
EVERGREEN HOSPITAL MEDICAL CTR (Continued)

Facility ID: 77233621
Data Year: 2015
Comments: SOURCE - LAB

Facility ID: 77233621
Data Year: 2015
Comments: This waste stream is generated from the use of a two-part product, Part A and Part B, which are mixed in the disinfection machine. Part A is acidic, but when mixed with Part B, a buffer, and used for its intended purpose, yields a waste effluent with a pH near neutral. Studies done onsite show that about half the cycles generate a waste that has an acceptable pH (6.7 or 6.8) and about half the cycles generate a waste that has an unacceptable pH (4.7-4.1)

Facility ID: 77233621
Data Year: 2015
Comments: This waste stream is generated from two tabletop Medivator machines. The product is a one-part disinfectant containing 2.5% glutaraldehyde. King County allows waste up to 4% glutaraldehyde to be discharged without pretreatment because it is readily decomposed in wastewater treatment plants. However, waste containing glutaraldehyde designates as a Category C toxic waste in Washington.

Facility ID: 77233621
Data Year: 2016
Comments: A-7: Disposal of mercury filled Blood Pressure cuff no longer used

Facility ID: 77233621
Data Year: 2016
Comments: A-7: Outdated chemical from Laboratory

Facility ID: 77233621
Data Year: 2016

#### Facility ID: 77233621

**Data Year:** 2015

**Comments:** Spill clean-up material

**Data Year:** 2015

**Comments:** Spill clean-up debries.

**Data Year:** 2015

**Comments:** A-7: mercury debries disposal - outdated equipment

**Data Year:** 2015

**Comments:** Out of spec or outdated chemicals from Lab

**Data Year:** 2015

**Comments:** Most waste formalin is evidently neutralized by Pathology staff and discharged to the sanitary sewer.

**Data Year:** 2015

**Comments:** Waste formalin is occasionally recycled by Pathology staff when it meets certain quality criteria. The formalin is reused to preserve specimens.

**Data Year:** 2015

**Comments:** SOURCE - LAB

**Data Year:** 2015

**Comments:** This waste stream is generated from the use of a two-part product, Part A and Part B, which are mixed in the disinfection machine. Part A is acidic, but when mixed with Part B, a buffer, and used for its intended purpose, yields a waste effluent with a pH near neutral. Studies done onsite show that about half the cycles generate a waste that has an acceptable pH (6.7 or 6.8) and about half the cycles generate a waste that has an unacceptable pH (4.7-4.1).

**Data Year:** 2015

**Comments:** This waste stream is generated from two tabletop Medivator machines. The product is a one-part disinfectant containing 2.5% glutaraldehyde. King County allows waste up to 4% glutaraldehyde to be discharged without pretreatment because it is readily decomposed in wastewater treatment plants. However, waste containing glutaraldehyde designates as a Category C toxic waste in Washington.

**Facility ID:** 77233621

<td>This waste stream is generated from the use of a two-part product, Part A and Part B, which are mixed in the disinfection machine. Part A is acidic, but when mixed with Part B, a buffer, and used for its intended purpose, yields a waste effluent with a pH near neutral. Studies done onsite show that about half the cycles generate a waste that has an acceptable pH (6.7 or 6.8) and about half the cycles generate a waste that has an unacceptable pH (4.7-4.1)</td>
</tr>
</tbody>
</table>
EVERGREEN HOSPITAL MEDICAL CTR (Continued)  1004793242

Data Year: 2015
Comments: This waste stream is generated from two tabletop Medivator machines. The product is a one-part disinfectant containing 2.5% glutaraldehyde. King County allows waste up to 4% glutaraldehyde to be discharged without pretreatment because it is readily decomposed in wastewater treatment plants. However, waste containing glutaraldehyde designates as a Category C toxic waste in Washington.

Facility ID: 77233621
Data Year: 2015
Comments: This product was used in CPC (subsequently discontinued) to disinfect endoscopes.

Facility ID: 77233621
Data Year: 2016
Comments: A-7: Disposal of mercury filled Blood Pressure cuff no longer used

Facility ID: 77233621
Data Year: 2016

<td>This waste stream is generated from the use of a two-part product. Part A and Part B, which are mixed in the disinfection machine. Part A is acidic, but when mixed with Part B, a buffer, and used for its intended purpose, yields a waste effluent with a pH near neutral. Studies done onsite show that about half the cycles generate a waste that has an acceptable pH (6.7 or 6.8) and about half the cycles generate a waste that has an unacceptable pH (4.7-4.1)</td>

  **Comments:** SOURCE - LAB
EVERGREEN HOSPITAL MEDICAL CTR  (Continued)

Comments: This waste stream is generated from the use of a two-part product, Part A and Part B, which are mixed in the disinfection machine. Part A is acidic, but when mixed with Part B, a buffer, and used for its intended purpose, yields a waste effluent with a pH near neutral. Studies done onsite show that about half the cycles generate a waste that has an acceptable pH (6.7 or 6.8) and about half the cycles generate a waste that has an unacceptable pH (4.7-4.1).

Facility ID: 77233621  
Data Year: 2015  
Comments: This product was used in CPC (subsequently discontinued) to disinfect endoscopes.

Facility ID: 77233621  
Data Year: 2016  
Comments: Most waste formalin is evidently neutralized by Pathology staff and discharged to the sanitary sewer.

Facility ID: 77233621  
Data Year: 2016  
Comments: Waste formalin is occasionally recycled by Pathology staff when it meets certain quality criteria. The formalin is reused to preserve specimens.

Site name: SEATTLE CANCER CARE ALLIANCE AT EVERGREEN

Classification: Conditionally Exempt Small Quantity Generator

Waste code: D001

Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

Waste code: P001
